We deliver!**

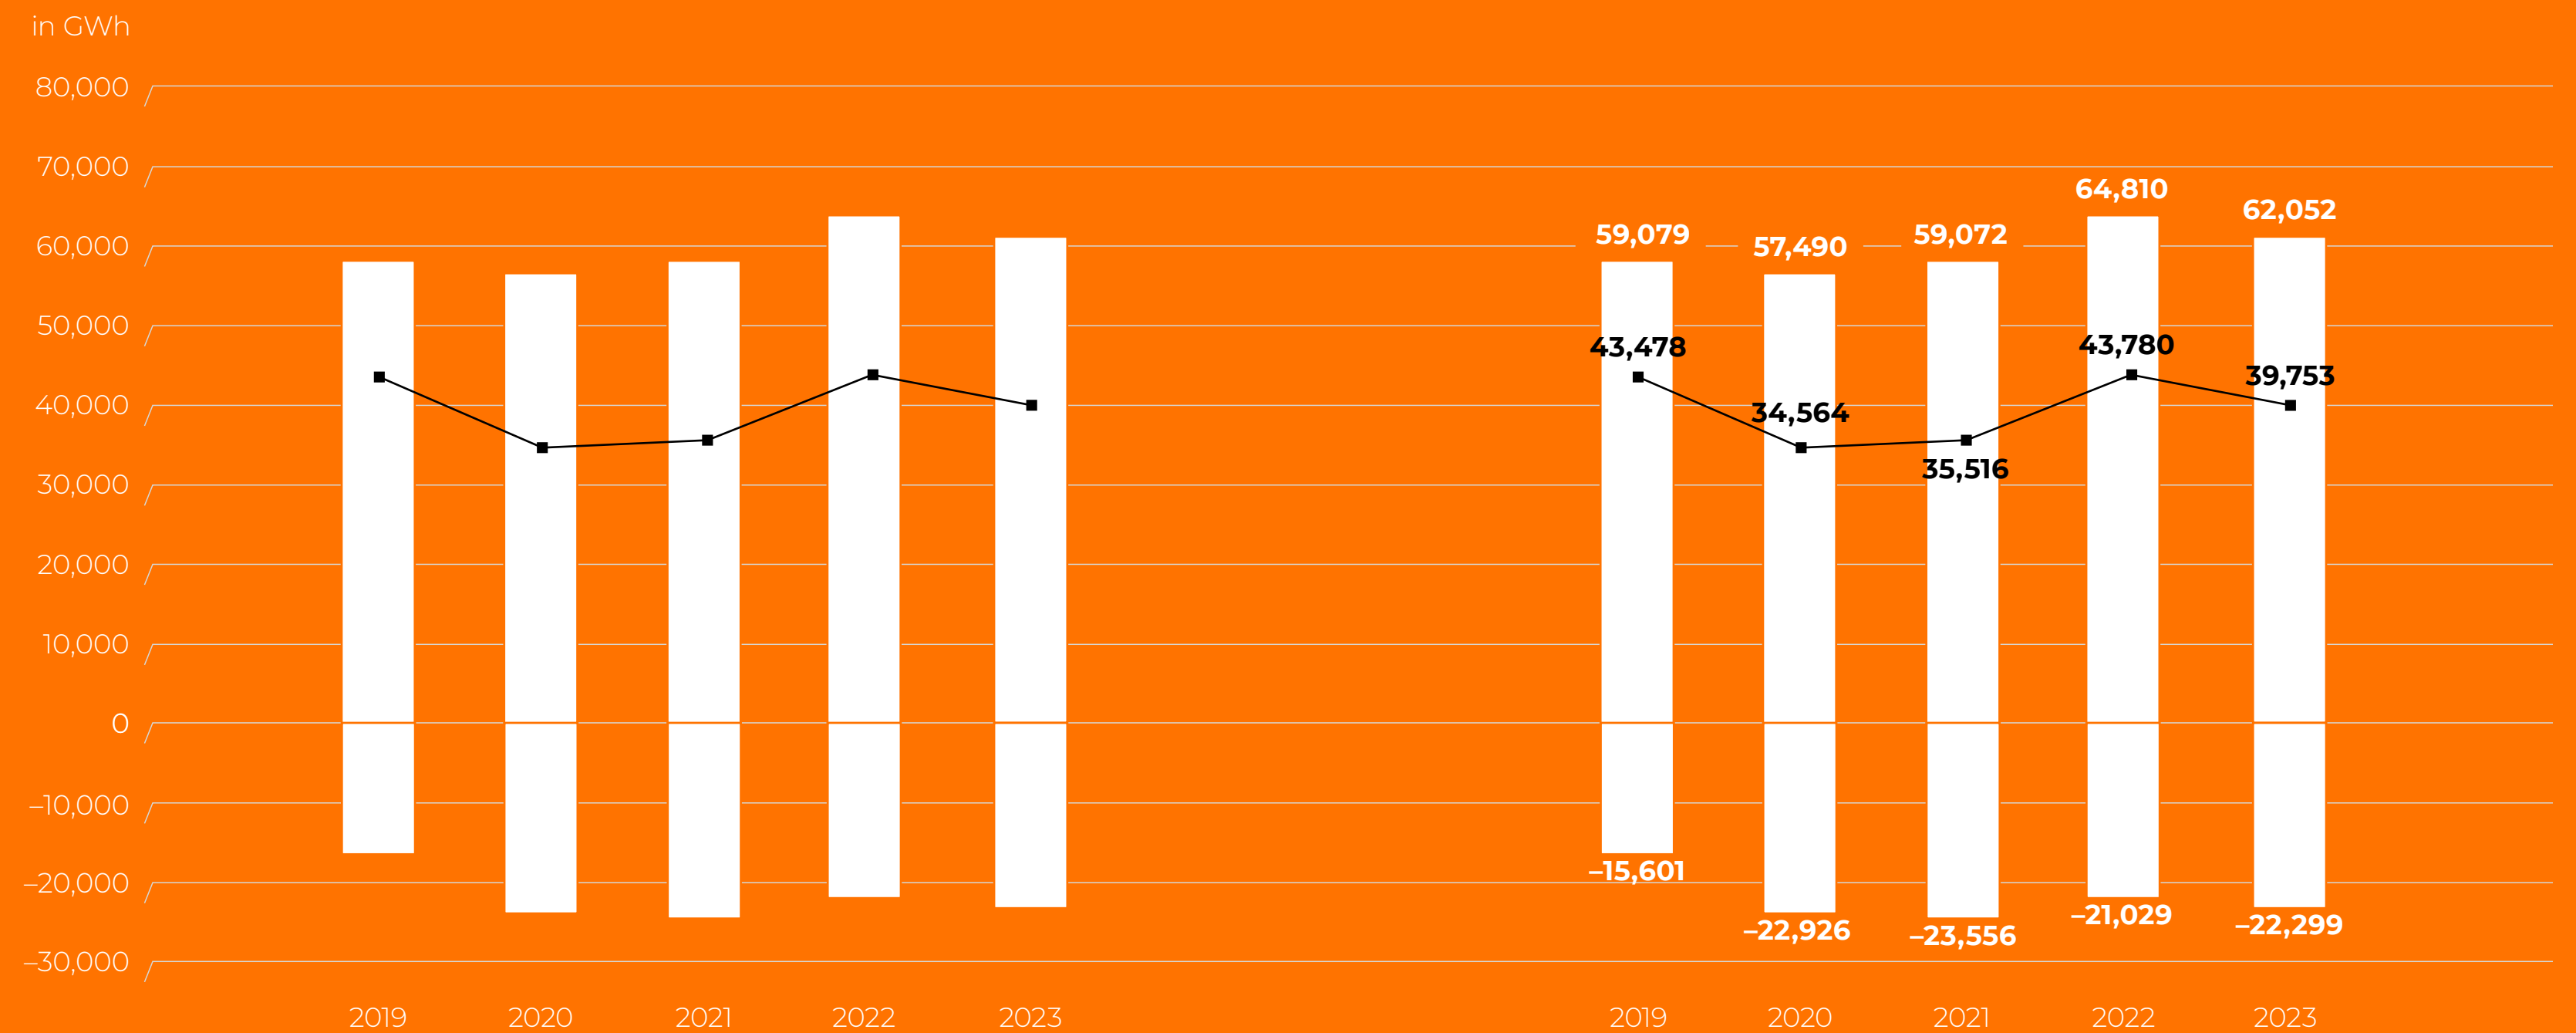

About this document

This interactive document uses mouse-over effects. Key figures in diagrams and tables can be displayed or hidden simply by moving the mouse pointer over them. The icon on the left indicates where this feature is available.

Where external sources are referenced, they are mentioned underneath the corresponding graphic.

You can also use the navigation at the top to navigate forwards and backwards or jump directly to the desired chapter.

Key data for 50Hertz

As a transmission system operator in the heart of Europe, 50Hertz is committed to the secure integration of renewable energy sources, the development of the European electricity market and the maintenance of a high standard of supply security. We operate the electricity transmission system in the north and east of Germany, and are expanding it to meet the requirements of the energy transition. We are leaders in the secure integration of renewable energy sources – by 2032, we aim to achieve 100 per cent coverage for the load in our grid area from renewable energy sources, averaged over the year.

Transparent and non-discriminatory business practices are at the core of our commitment to social responsibility. Our Almanac provides a concise overview of the most important data and facts on the transmission system and 50Hertz grid area in a German and European context.

Conversion table

kV (kilovolt)	1,000 volts, voltage
kW (kilowatt)	1,000 watts, power
MW (megawatt)	1,000 kilowatts
GW (gigawatt)	1 million kilowatts
kWh (kilowatt-hour)	1,000 watt-hours, work
MWh (megawatt-hour)	1,000 kilowatt-hours
GWh (gigawatt-hour)	1 million kilowatt-hours
TWh (terawatt-hour)	1 billion kilowatt-hours

Key data for 2023

An overview of 50Hertz

Investment volume	EUR 1,686 million (EUR 1,086 million in 2022)
Profit IFRS	EUR 220 million (EUR 136 million in 2022)
Employees	Around 1,800
New employees	323
Proportion of women in the workforce overall	Around 25.5%

Circuit length (km)	10,658	(≈28%*)
Circuit length of 380 kV AC overhead lines	7,535	
Circuit length of 220 kV AC overhead lines	2,375	
Circuit length of 380 kV AC cables	55	
Circuit length of 400 kV DC cables (HVDC)	15	
Circuit length of 220 kV AC cables	3	
Circuit length of 150 kV AC offshore cables	290	
Circuit length of 220 kV AC offshore cables	385	

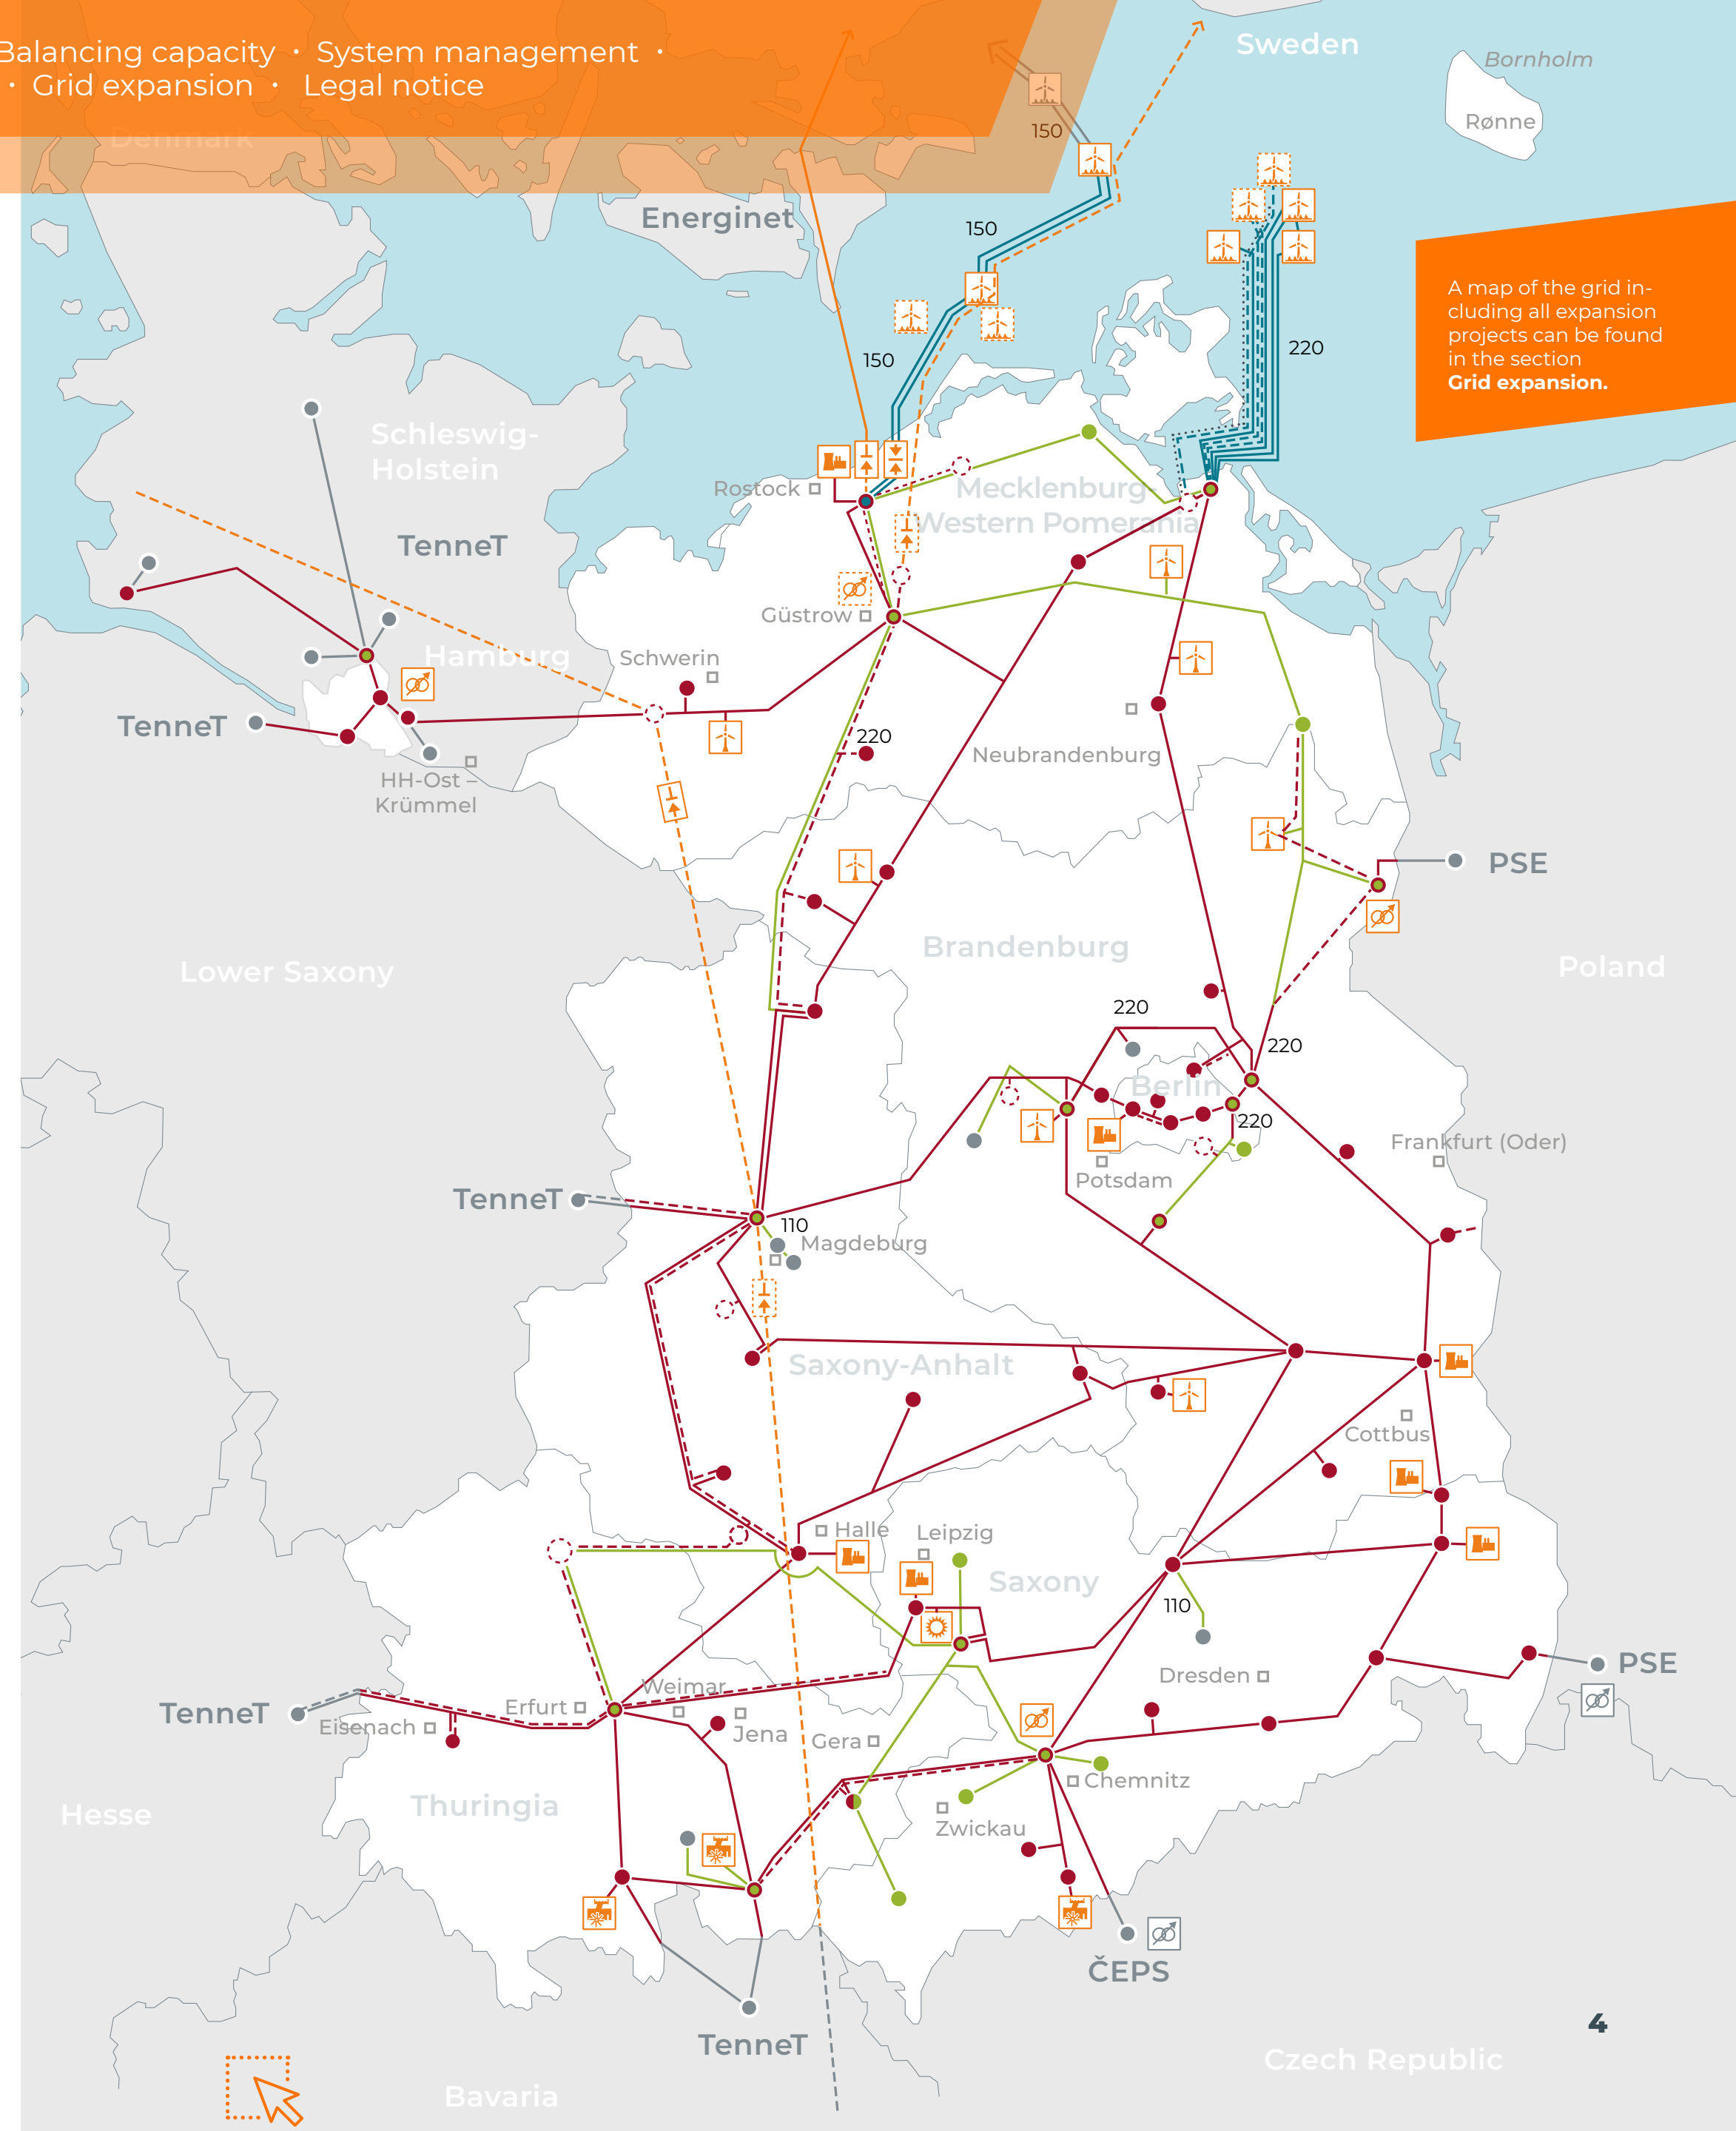

Number of installations	81
Substations	67
Switching stations	10
Third-party substations and switching stations	4

Transformer capacity (MVA)	67,660
EHV/EHV (Extra-High Voltage/Extra-High Voltage)	23,500
EHV/HV (Extra-High Voltage/High Voltage)	44,160

General information	
Geographical area (km ²)	109,715 (≈31%*)
Population (millions)	18.2 (≈22%*)

* Proportion of total for Germany

 There may be rounding differences in the summing up of the individual values.

Capacity and generation

Installed capacity in the 50Hertz grid area

Installed capacity

Figures in MW	2019	2020	2021*	2022*	2023*
Renewable energy sources					
Wind, onshore	18,711	19,138	19,748	20,414	21,078
Wind, offshore	1,068	1,068	1,093	1,093	1,352
Water	284	281	174	174	177
Photovoltaics	12,204	13,552	16,359	18,175	21,145
Landfill, sewage-treatment and mine gas	70	67	59	60	68
Biomass	1,980	2,023	2,037	2,069	2,053
Total for renewable energy sources	34,316	36,129	39,470	41,986	45,873
Conventional energy sources					
Lignite	9,762	9,729	10,234	10,103	9,872
Coal	3,234	3,234	1,624	1,586	1,584
Natural gas	5,738	5,680	5,900	6,330	6,509
Oil	979	795	1,089	1,153	1,199
Nuclear energy	0	0	0	0	0
Waste	419	473	473	496	477
Pumped-storage plants	2,793	2,793	2,793	2,793	2,793
Battery-storage plants	-	-	237	521	1,324
Other energy sources	192	192	195	338	352
Total for conventional energy sources	23,116	22,896	22,544	23,320	24,110
Total	57,432	59,025	62,014	65,306	69,983

Sources: Installed capacity of renewable energy sources: 50Hertz's EEG database for the reporting years 2019 and 2020, Core Energy Market Data Register (MaStR) of the German Federal Network Agency for the reporting year 2021 onwards, data extracted at the end of January 2024, as at a reporting date of 31/12/2023; installed net capacity of conventional energy sources: German Federal Network Agency power plant list, data extracted in November 2023, and Core Energy Market Data Register, data extracted in January 2024, as at a reporting date of 31/12/2023.

Installed capacity in the 50Hertz grid area by energy source, 2023

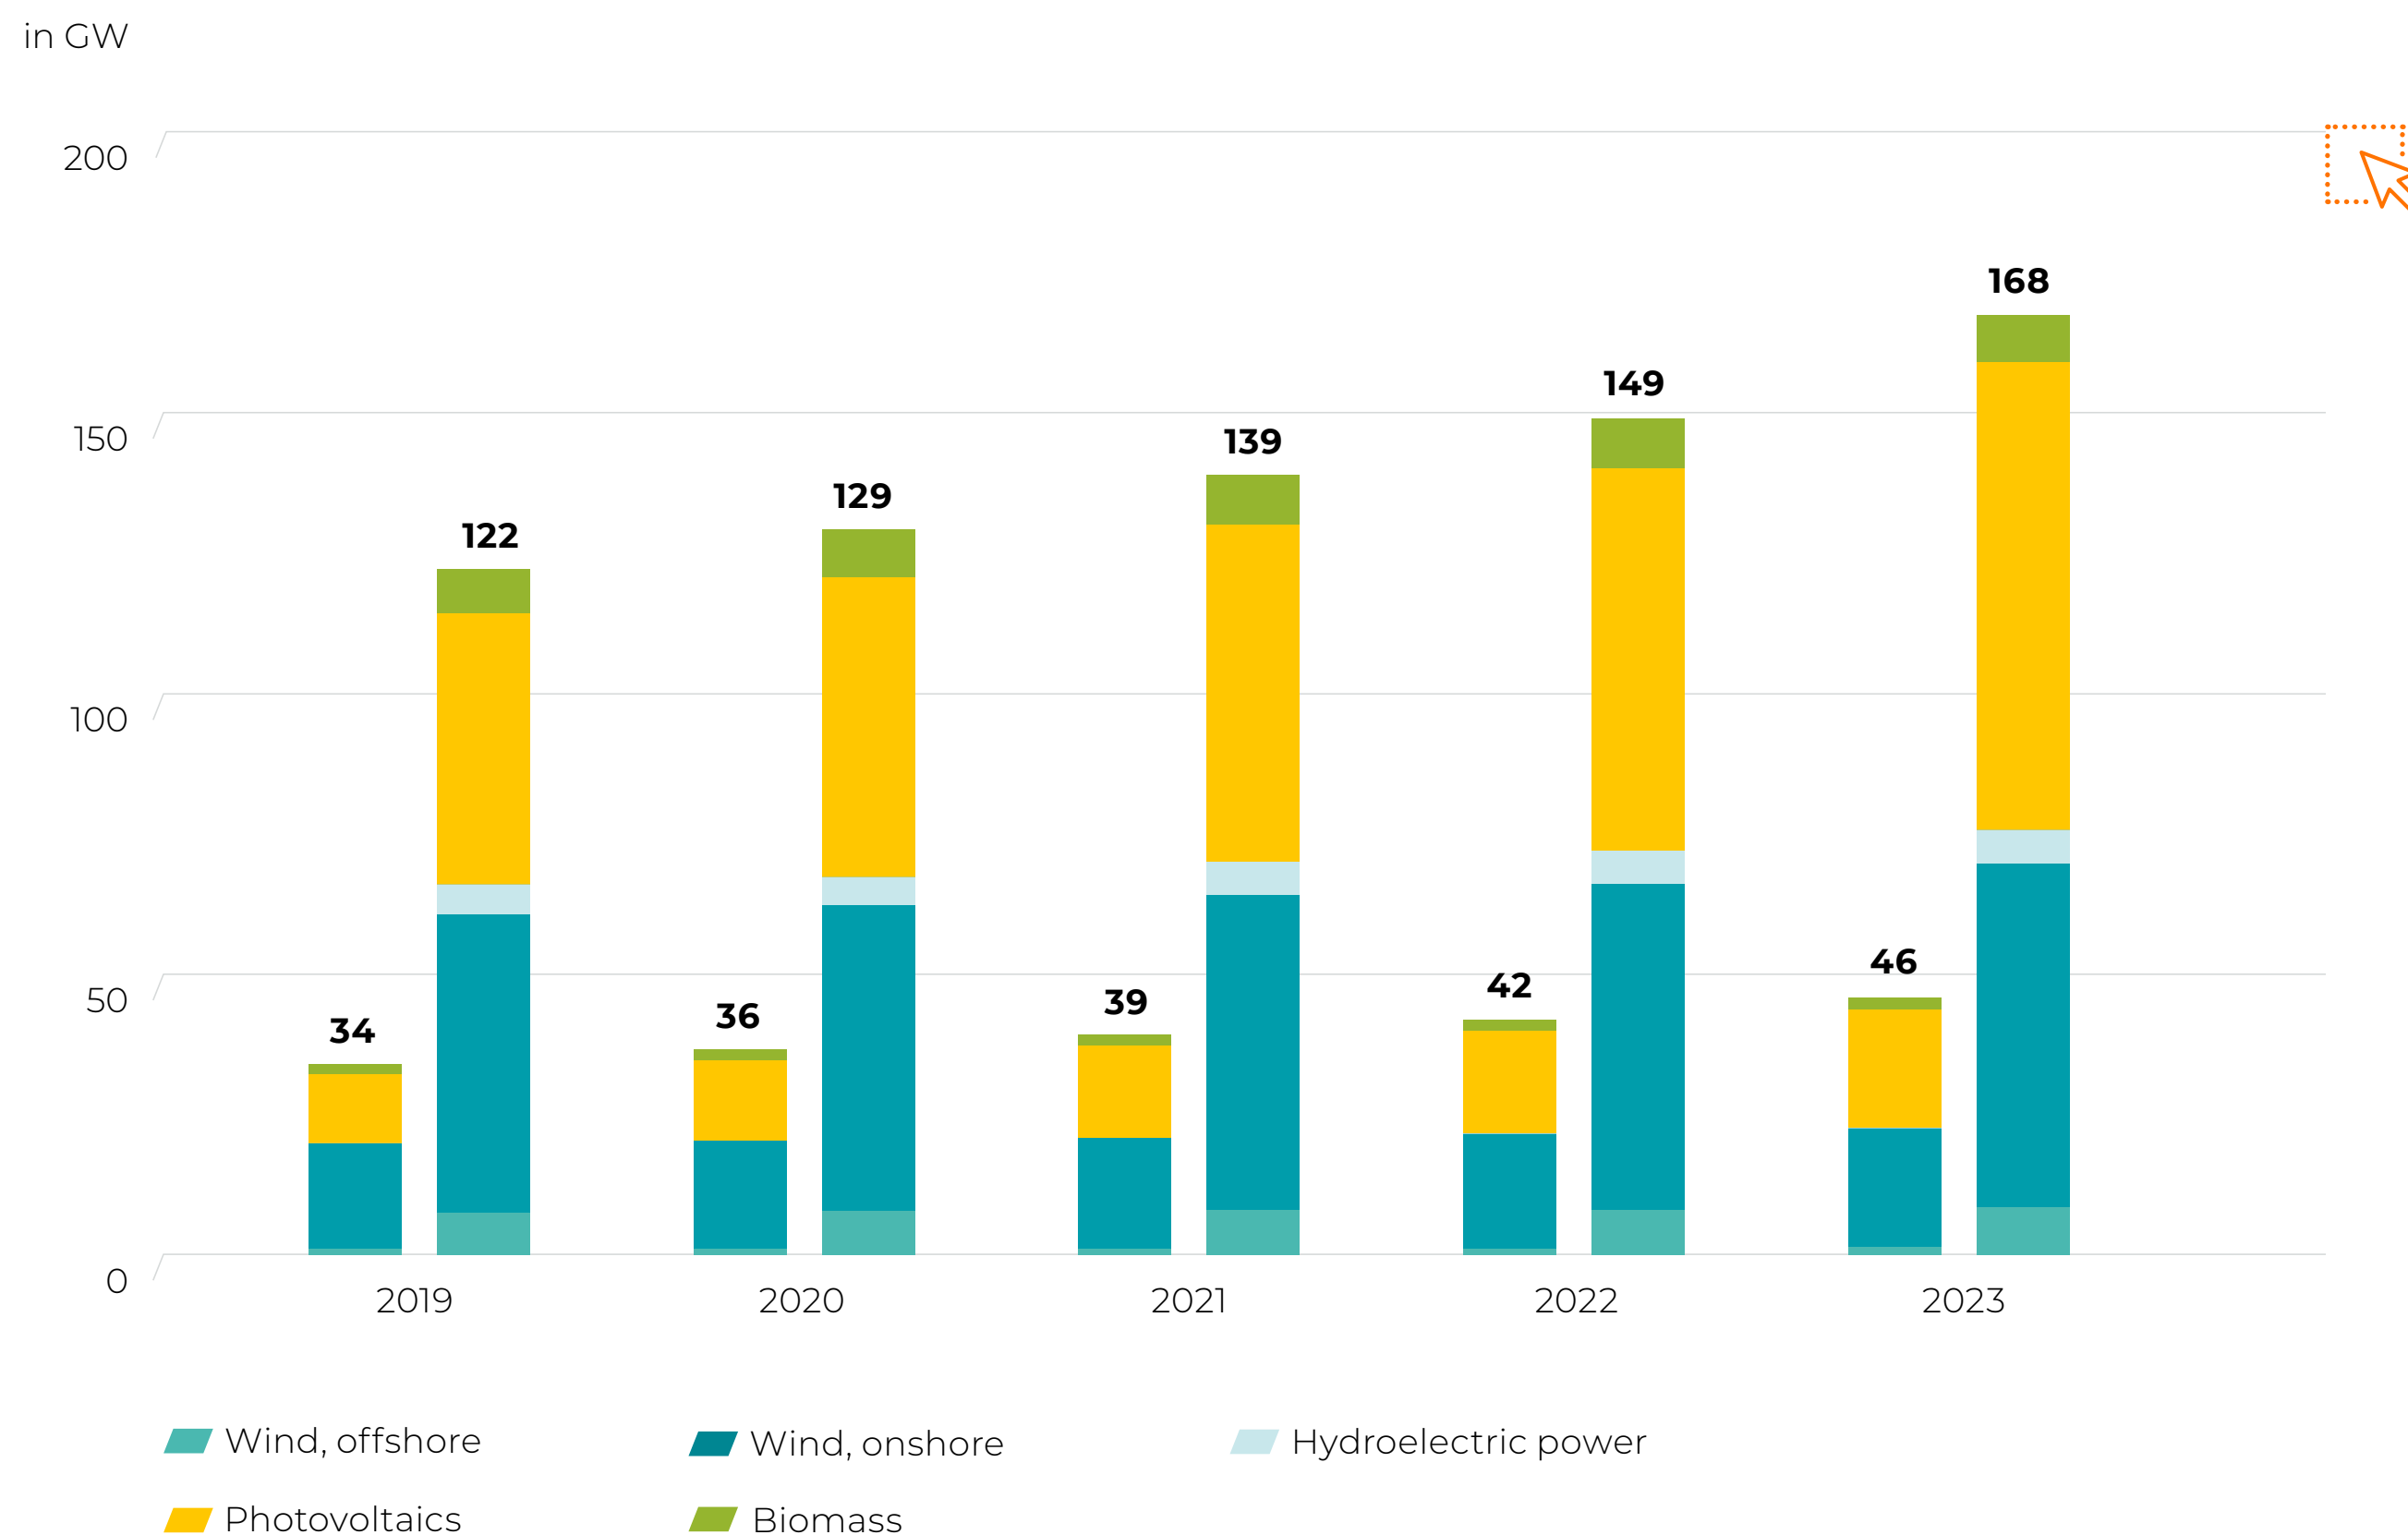

i * In the 2021 reporting year, the source used for the installed capacity of renewable energy sources was changed to the gross installed capacity from the Core Energy Market Data Register (MaStR). The Core Energy Market Data Register is maintained by the German Federal Network Agency and is the central data source for master data relating to all plant operators and installations on the basis of Sections 111e and 111f of the German Energy Industry Act and the German Ordinance on the Registration of Energy Industry Data (MaStRV).

There may be rounding differences in the summing up of the individual values.

Capacity and generation

Development of the installed capacity of renewable energy sources in the 50Hertz area and in Germany

① The left-hand bar of each pair indicates the values for 50Hertz, the right-hand bar indicates the values for Germany. The low quantities of water, landfill, sewage treatment and mine gas cannot be depicted but are included in the totals.

Source: Values for Germany: ENTSO-E Transparency Platform for 2019 and 2020, gross installed capacity from the Core Energy Market Data Register (MaStR) of the German Federal Network Agency from 2021 onwards.

50Hertz's share of the installed capacity of renewable energy sources in Germany in 2023

Capacity and generation

Development of the input from renewable energy sources in the 50Hertz grid area and in Germany

50Hertz's share of the input from renewable energy sources in Germany in 2023

Share of the input from renewable energy sources as a proportion of total consumption in the 50Hertz grid area in 2023

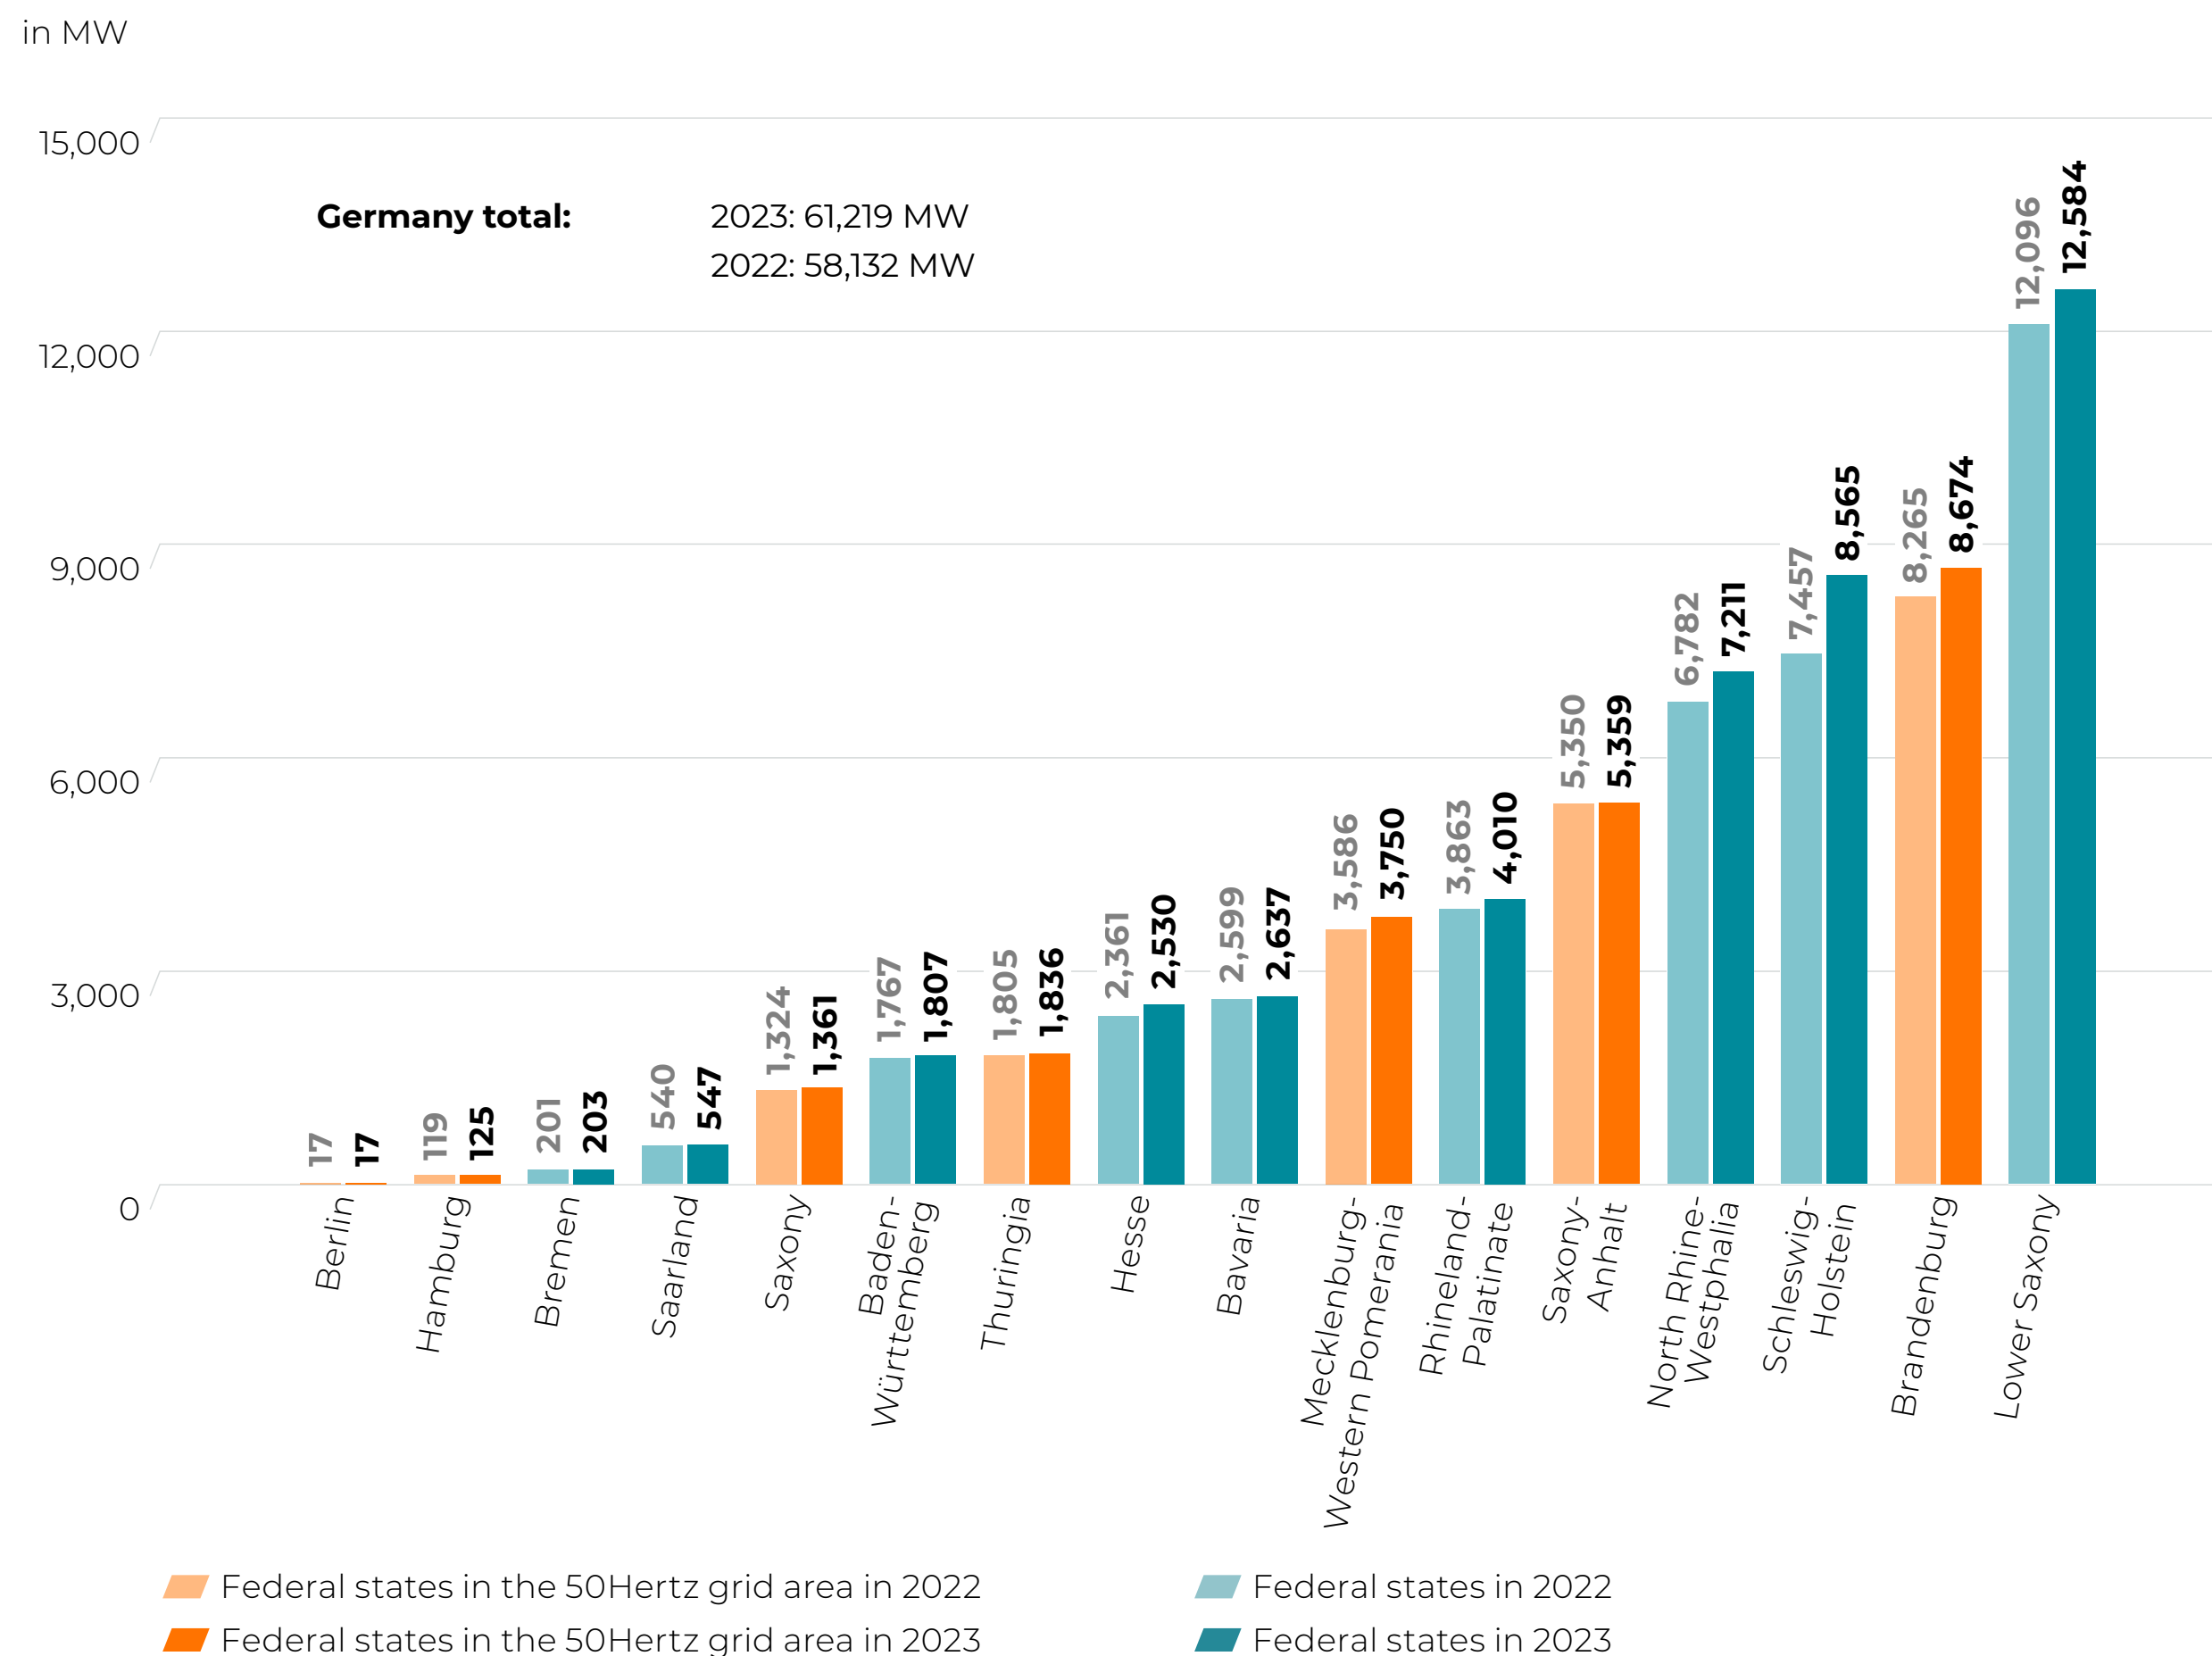

① The left-hand bar of each pair indicates the values for 50Hertz, the right-hand bar indicates the values for Germany. There may be rounding differences in the summing up of the individual values.

Source: Values for Germany: EEG annual account for 2019 to 2022, *2023 extrapolation values from the ENTSO-E Transparency Platform.

Capacity and generation

Geographical distribution of the installed onshore wind-power capacity in Germany by federal states in 2023

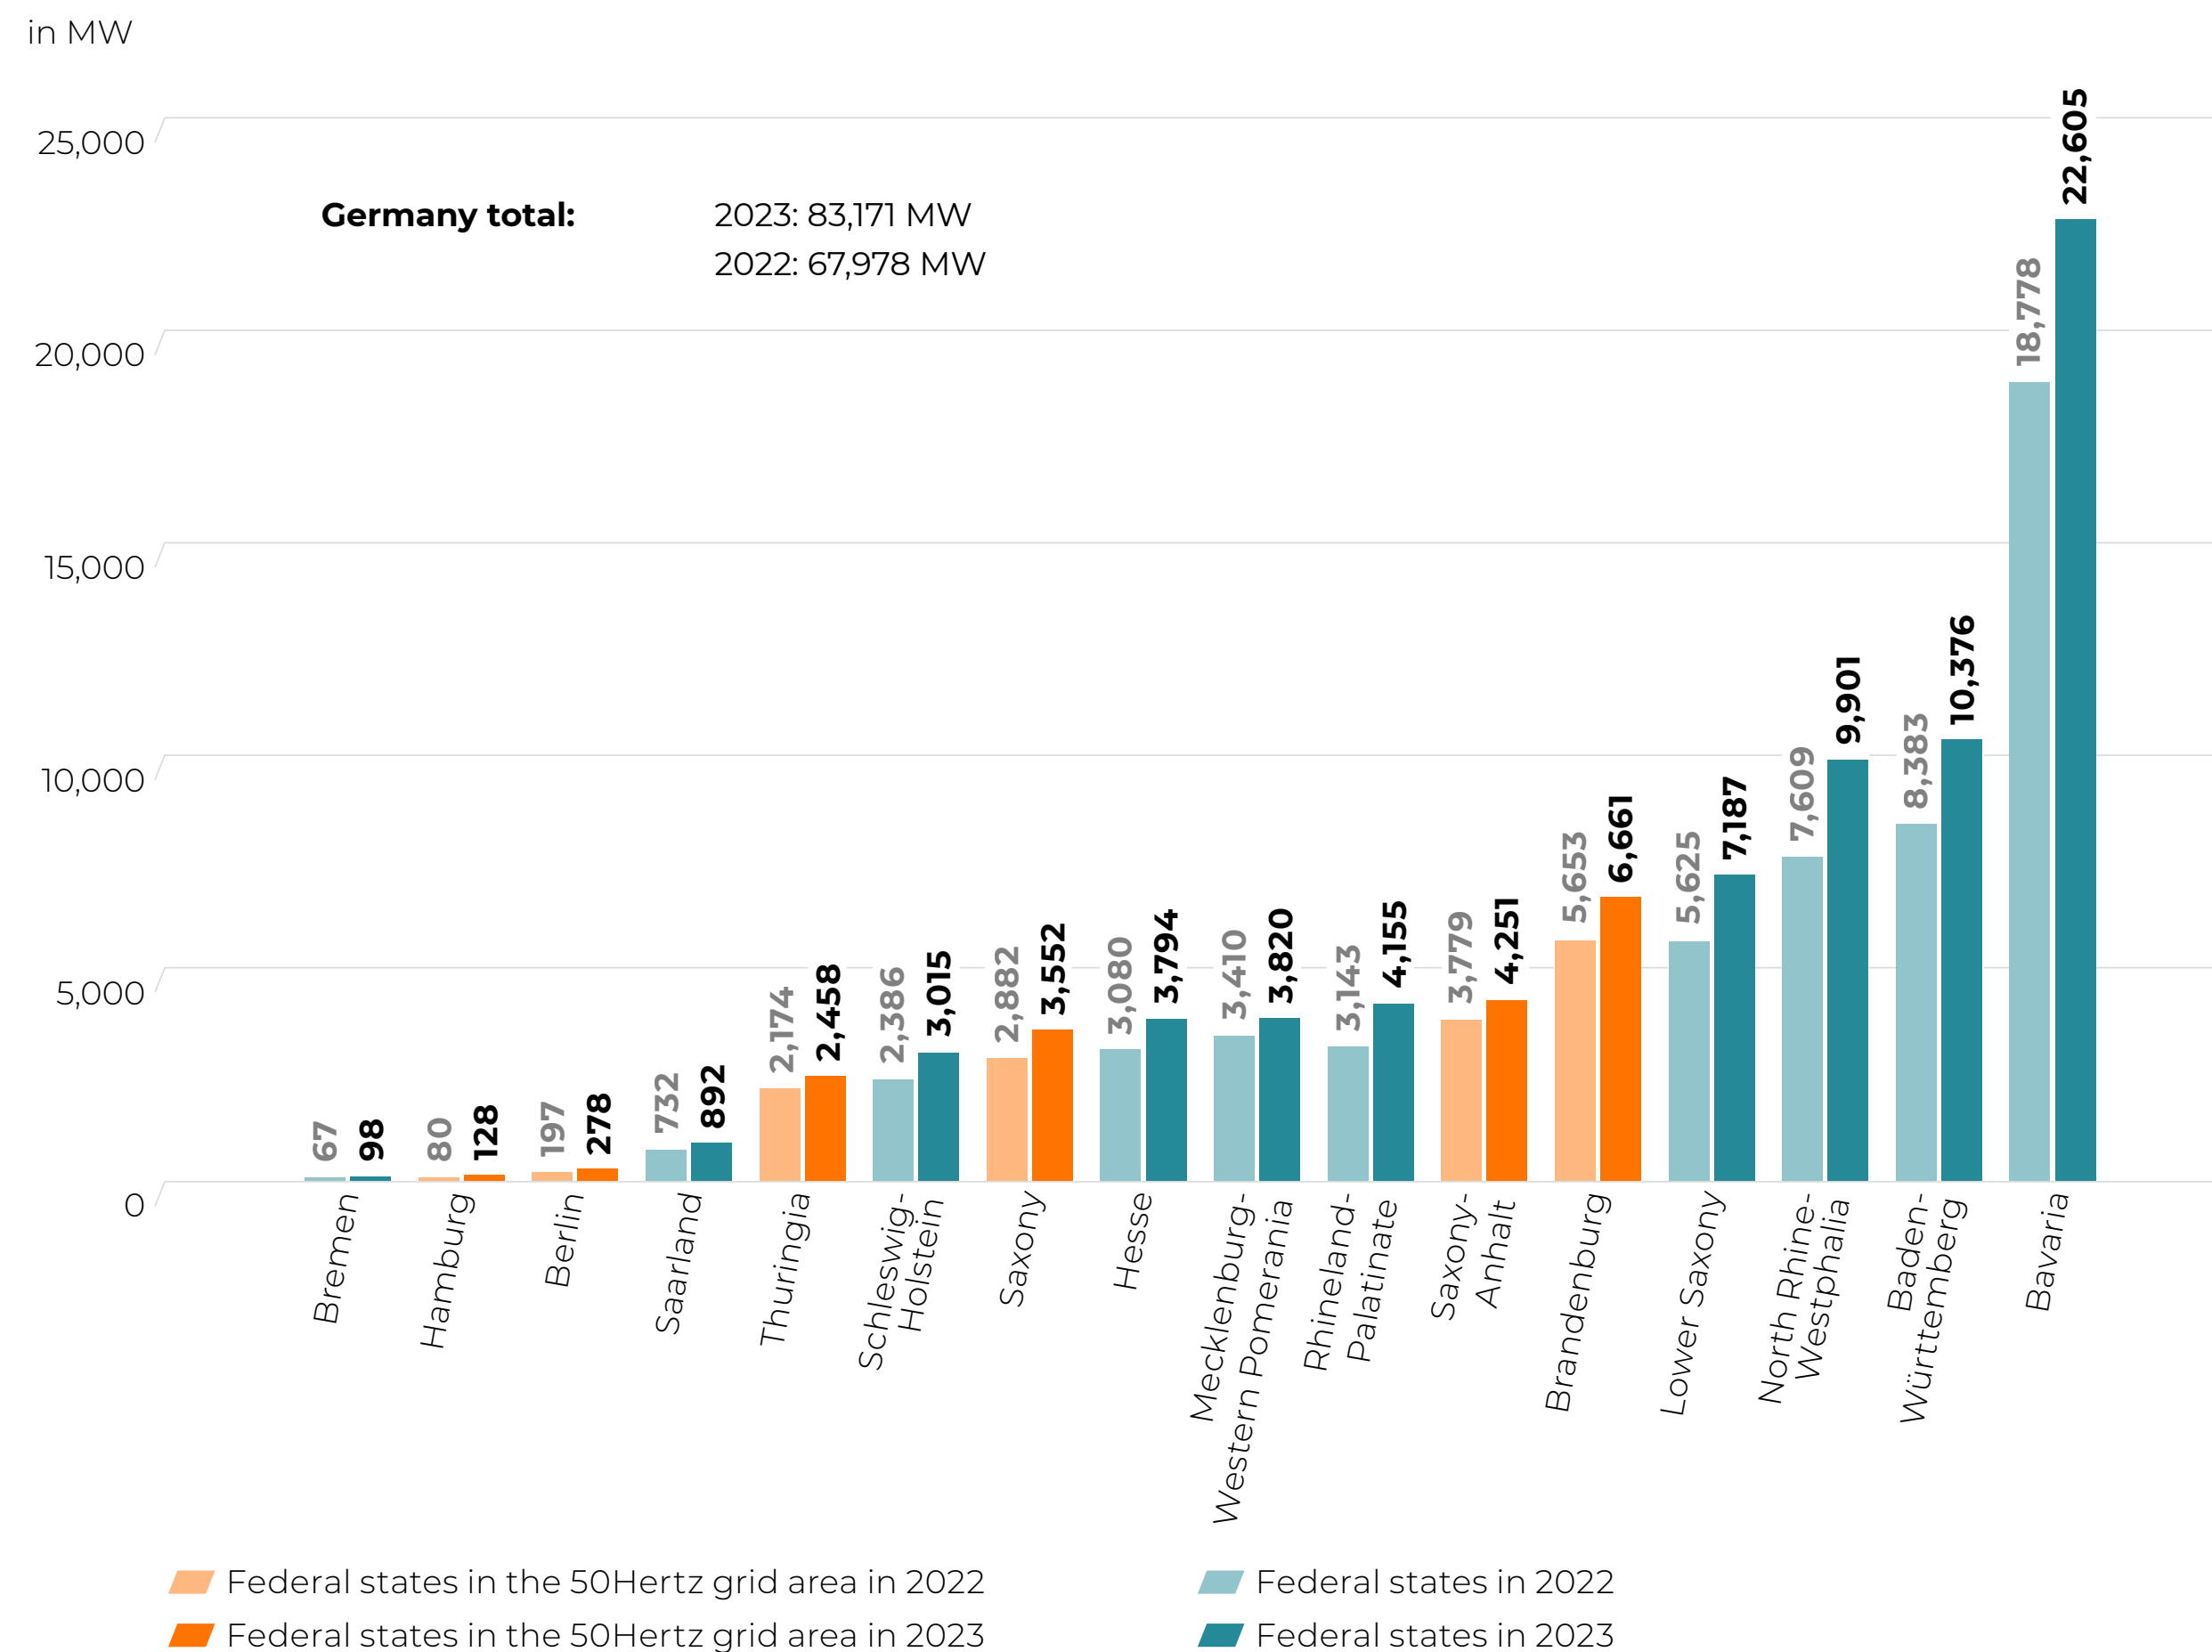

50Hertz's share of installed onshore wind-power capacity in Germany in 2023

Source: Core Energy Market Data Register (MaStR), extracted at the end of January 2024 as at a reporting date of 31/12/2023.

Capacity and generation

Geographical distribution of the installed photovoltaic capacity in Germany by federal states in 2023

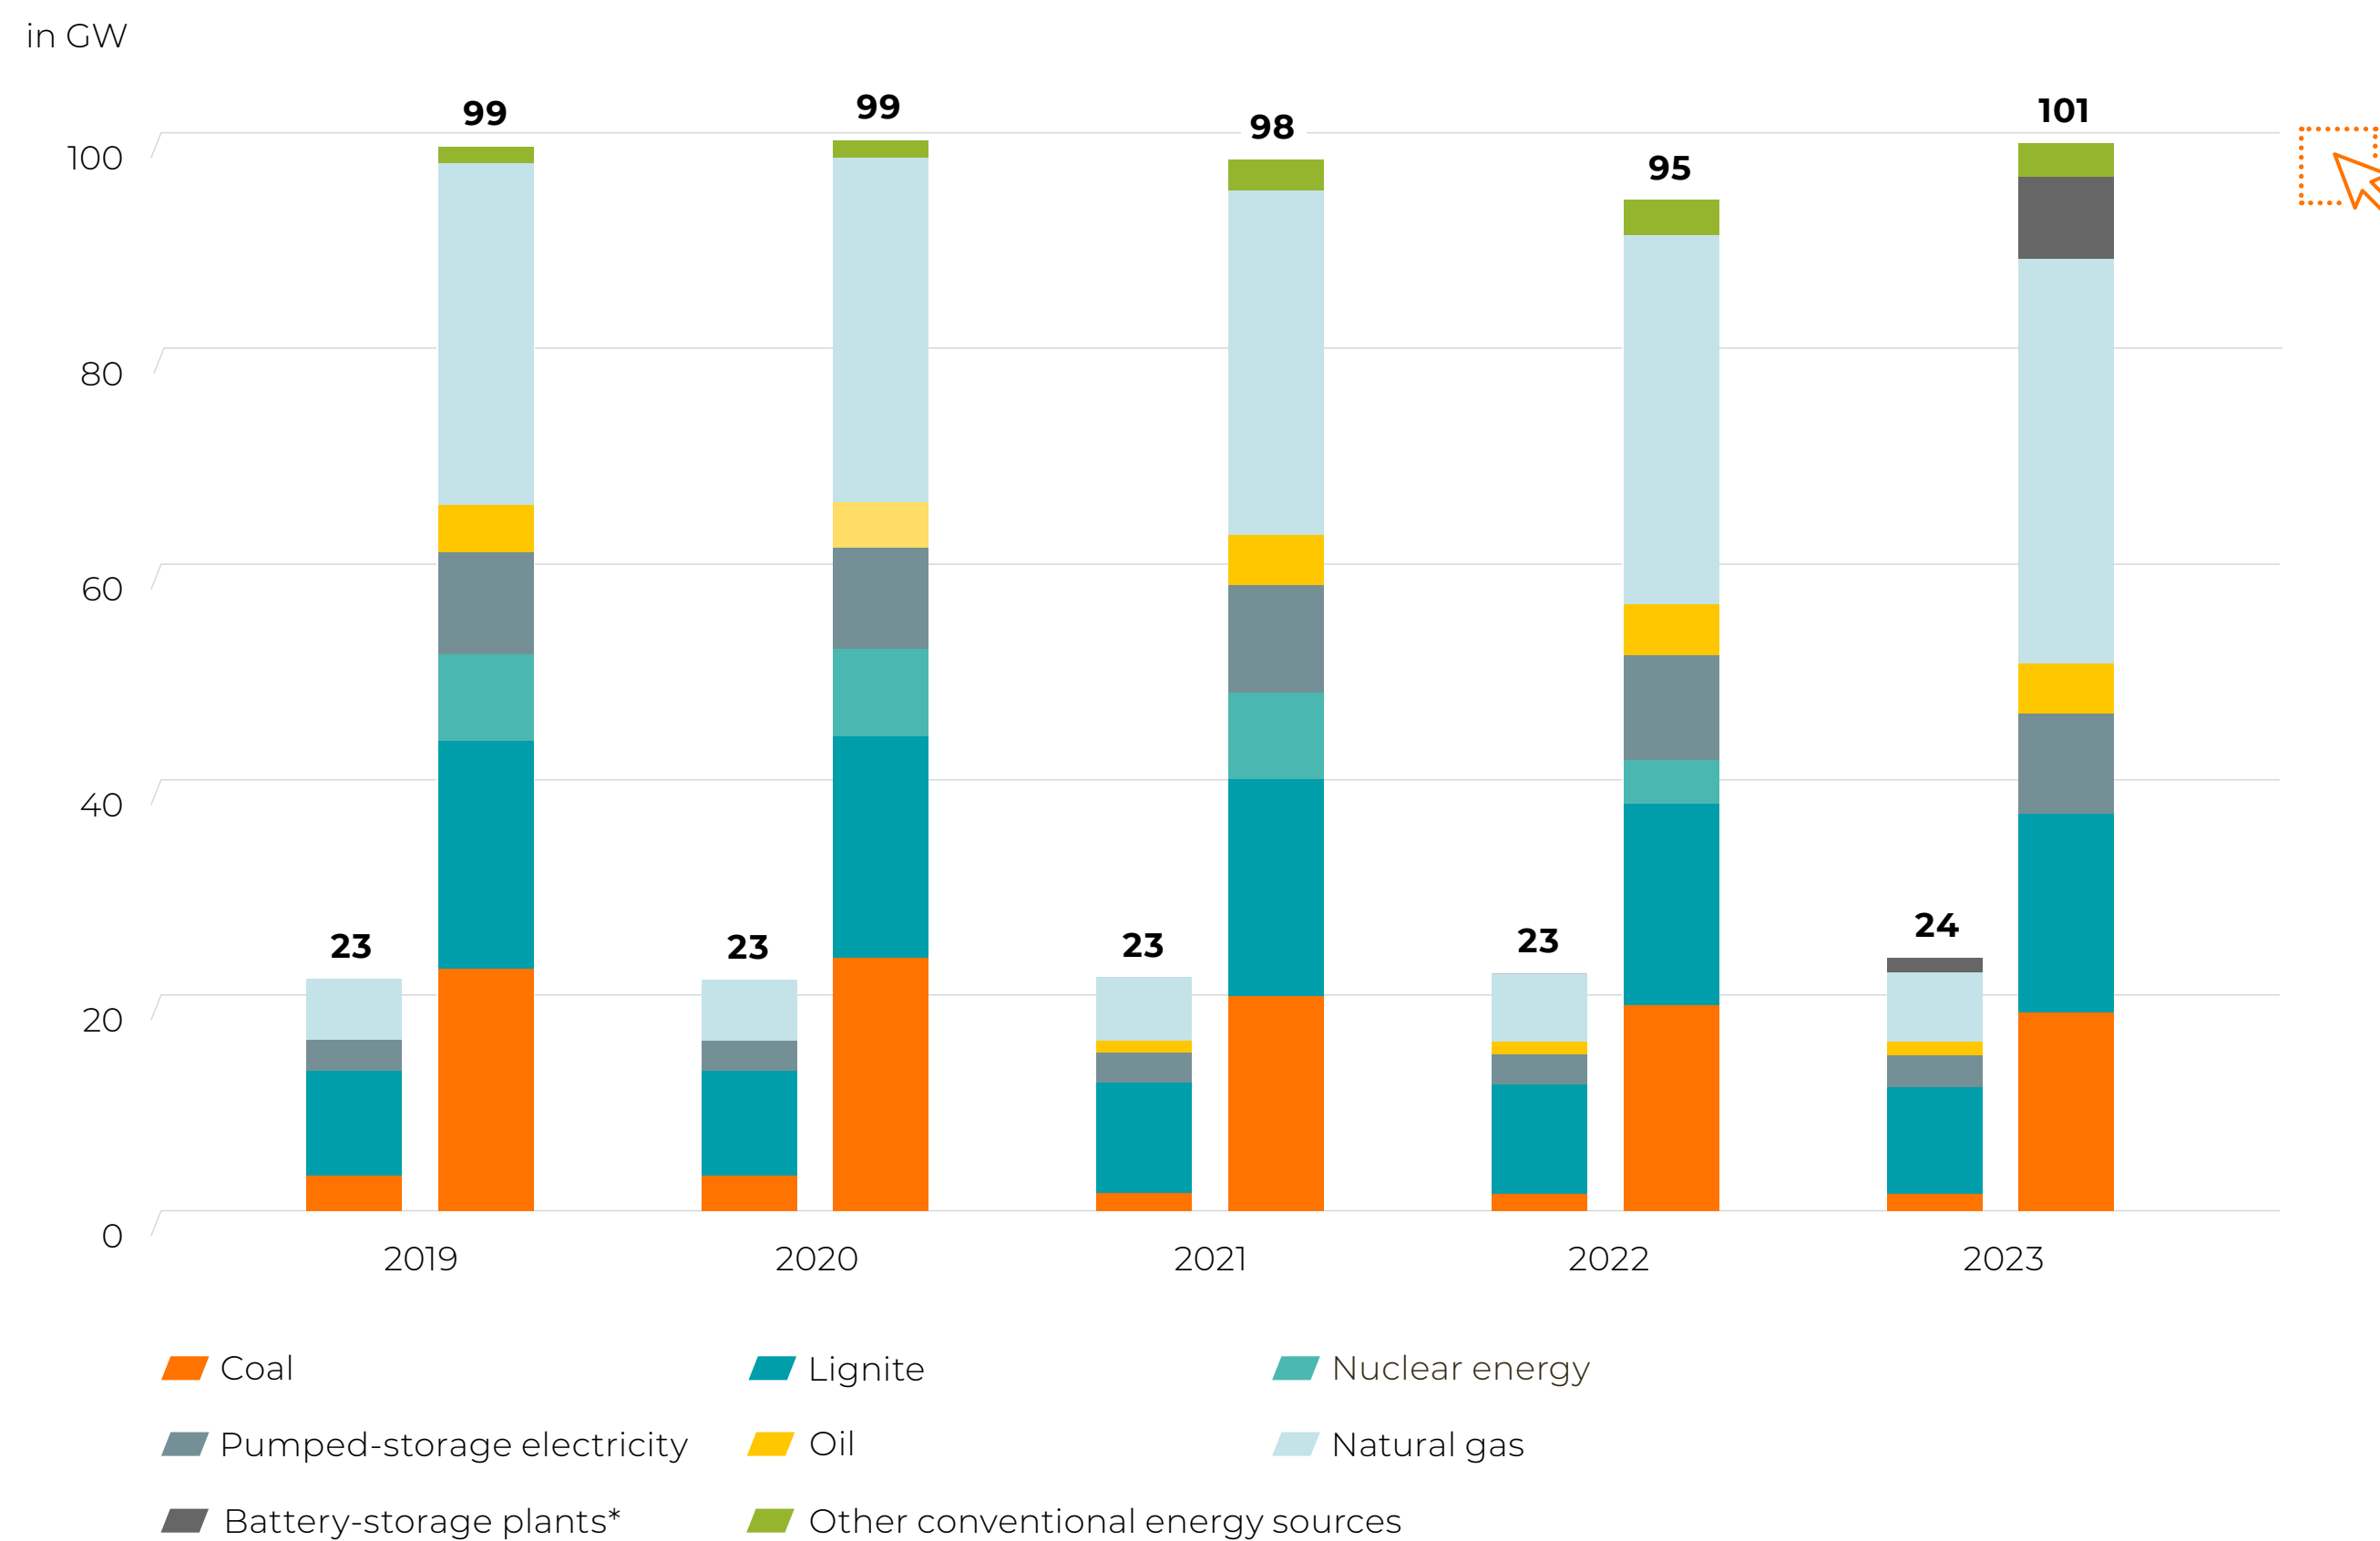

50Hertz's share of installed photovoltaic capacity in Germany in 2023

Source: Core Energy Market Data Register (MaStR), extracted at the end of January 2024 as at a reporting date of 31/12/2023.

Capacity and generation

Development of the installed net capacity of conventional power plants in the 50Hertz grid area and in Germany

i The left-hand bar of each pair indicates the values for 50Hertz, the right-hand bar indicates the values for Germany.
 No figures are shown for values < 1 GW.
 There may be rounding differences in the summing up of the individual values.

Source for Germany values: Power plant list and Core Energy Market Data Register (MaStR) of the German Federal Network Agency.
 * Battery storage plants have only been recognised as energy sources since 2023.

50Hertz's share of the installed net capacity of conventional power plants in Germany in 2023

Capacity and generation

Development of the input from conventional energy sources to the 50Hertz extra-high-voltage grid and in Germany

ⓘ The left-hand bar of each pair indicates the values for 50Hertz, the right-hand bar indicates the values for Germany. There may be rounding differences in the summing up of the individual values.

Source for Germany values: German local association of Energy and Water Industries (BDEW), preliminary figures.

50Hertz's share of the input from conventional energy sources in Germany in 2023

Capacity and generation

Key figures for the input from wind turbines (onshore and offshore) in the 50Hertz grid area

Figures in MW	2022	2023
Maximum simultaneous input	16,885	17,887
Minimum input	3	14
Biggest one-hour spike	3,277	2,975
Biggest one-hour drop	-2,590	-2,893
Biggest 15-minute spike	1,522	1,907
Biggest 15-minute drop	-1,412	-1,018
Biggest one-day spike	10,950	14,494

 Data based on extrapolated figures (15-minute mean capacity figures), including direct marketing.

Key figures for the input from photovoltaic plants in the 50Hertz grid area

Figures in MW	2022	2023
Maximum simultaneous input	11,062	11,895
Minimum input	0	0
Biggest one-hour spike	2,950	3,188
Biggest one-hour drop	-2,874	-2,844
Biggest 15-minute spike	805	1,333
Biggest 15-minute drop	-834	-775

 Data based on extrapolated figures (15-minute mean capacity figures), including direct marketing.

Load and consumption

Development of electricity consumption in the 50Hertz grid area

① For the year 2019, electricity consumption consisted of end consumption in accordance with the German Renewable Energy Sources Act (EEG) and self-supply subject to the EEG levy. Since 01/01/2020, the network losses of transmission system operators and distribution system operators have also been taken into account, as have pumped-storage plant losses. The foundation of the data for the electricity consumption in accordance with the EEG has also been abolished together with the EEG levy. Since 01/01/2022, the electricity consumption has been calculated based on the quantities withdrawn from the balancing zone accounting, and continues to include the network losses and pumped-storage plant losses.

Load and consumption

Monthly maximum and minimum load in the 50Hertz grid area, 2023

in GW

Annual maximum	16,462 MW on 05/12/2023 at 17:45
Annual minimum	6,649 MW on 28/05/2023 at 6:15

Balancing capacity

Development of costs by type of balancing capacity in Germany

 More information and the source of the above figures
can be found at:

Balancing capacity

Development of the imbalance price (reBAP)

The “box plot scheme” is a suitable format for presenting the distribution of the quarter-hourly imbalance price (reBAP) in the respective years. The edges of the box enclose 50% of the time period (i.e. 50% of all quarter hours in a year) and are bounded by the lower (Q1 = 25%) and upper quartile (Q3 = 75%). This excludes the quarter hours with the cheapest or most expensive 25% of the reBAPs that occur. The line within the box shows the median (Q2 = 50%) of all occurring values; i.e. half of all data points are larger and half are smaller. Together with the quartiles, the median gives an indication of the dispersion and skewness of the data. The whiskers indicate the level up to which the values are within the limits of $Q1 - 1.5 \times (Q3 - Q1)$ and $Q3 + 1.5 \times (Q3 - Q1)$. The whiskers thus show how the extremes of the data set are spread and give an impression of the volatility of the reBAP. Extreme outliers (quarter hours with particularly high/low prices) are not included in this box plot.

i Outliers are not depicted.

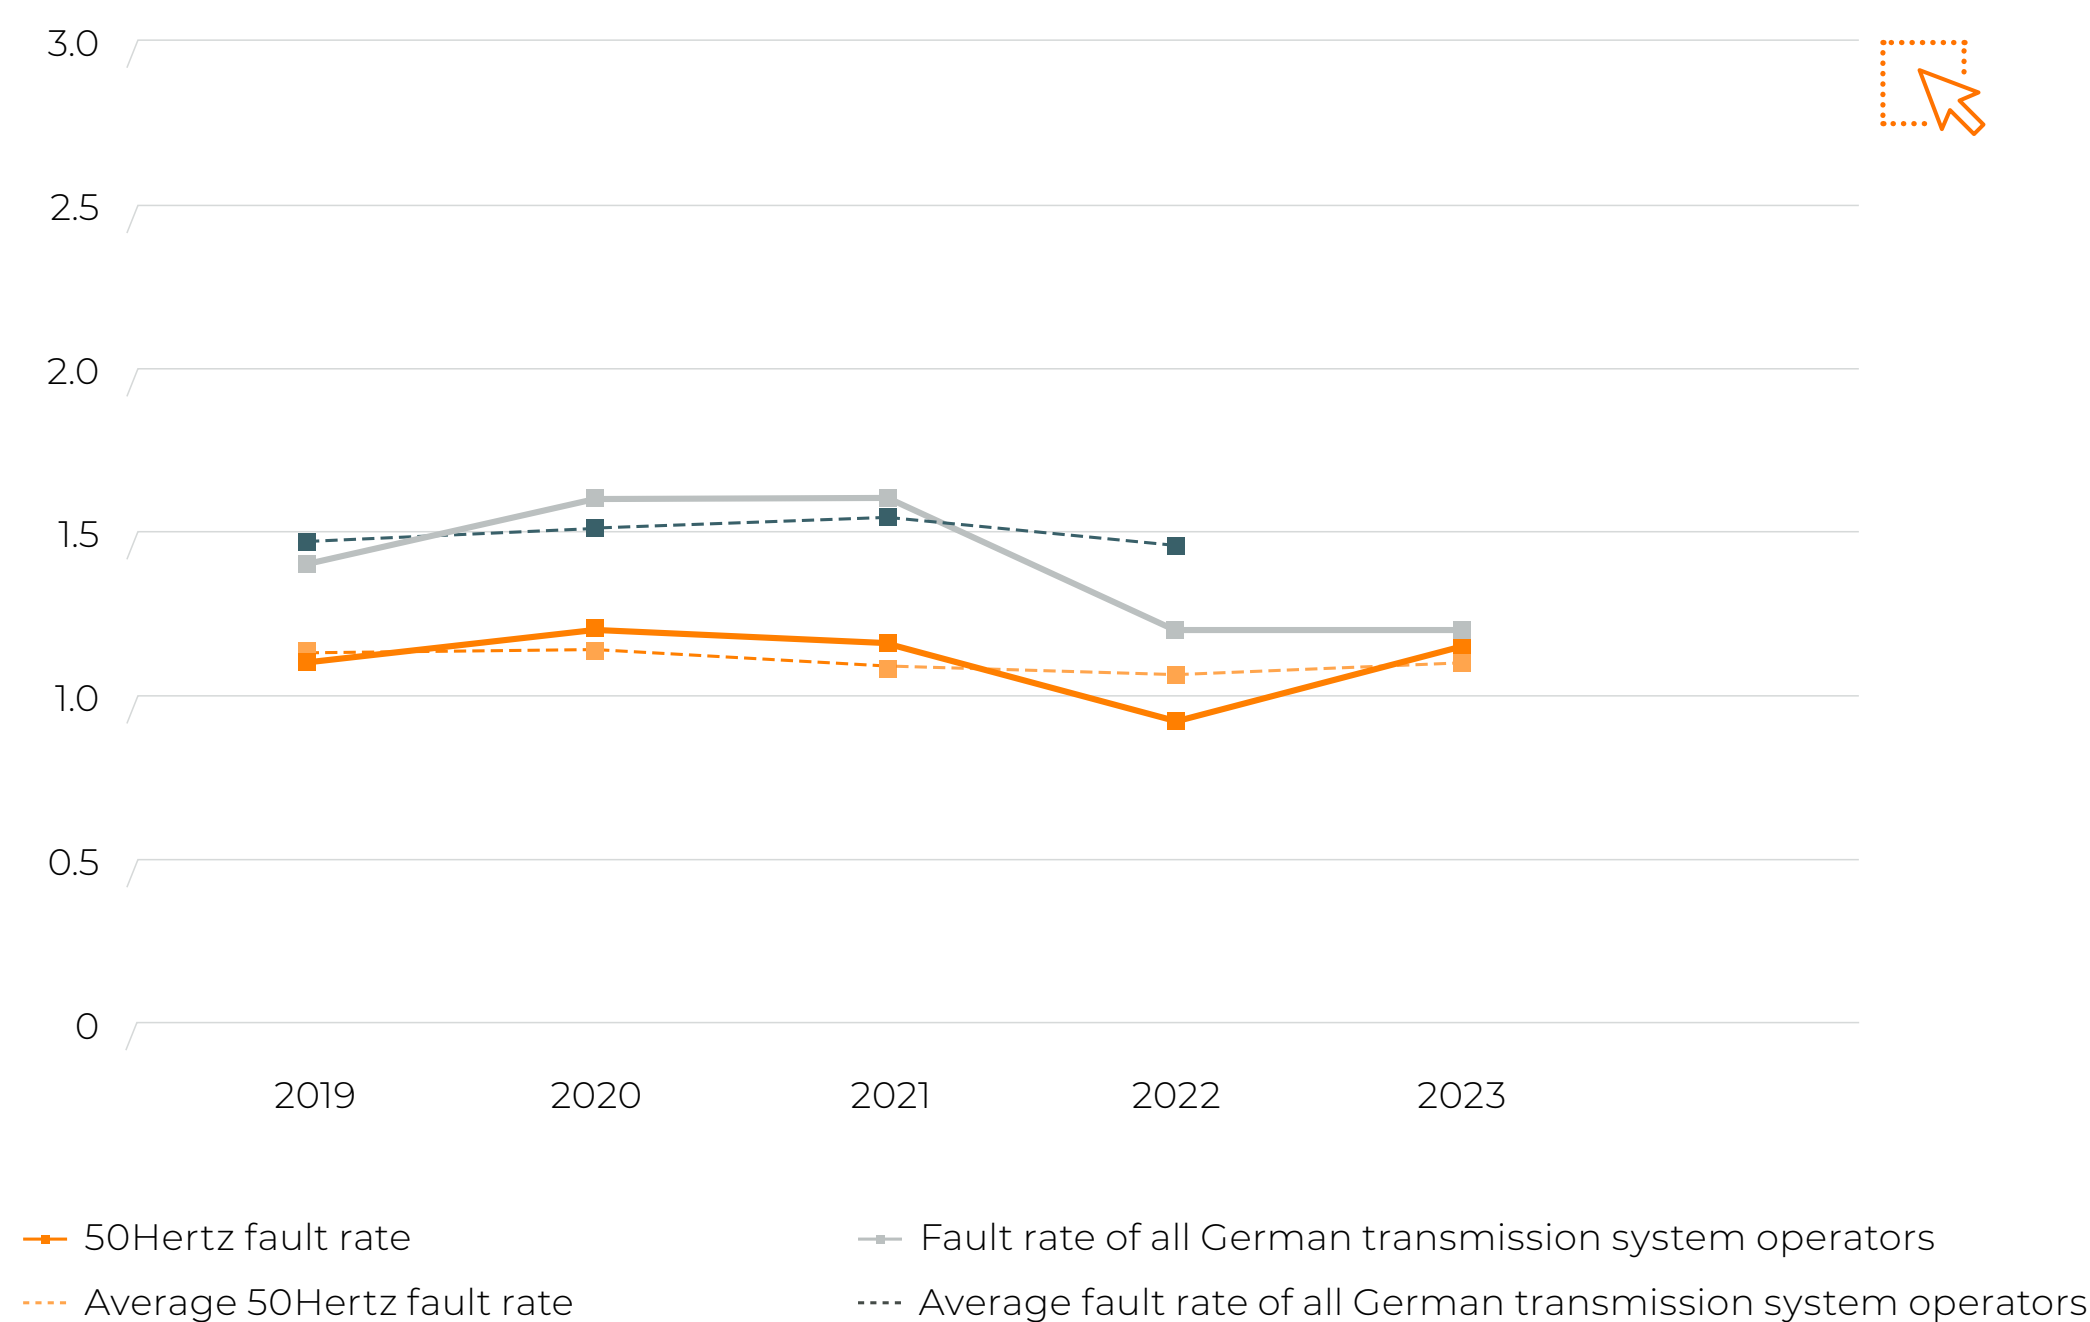

Extensive market changes came into effect on 22/06/2022: Introduction of the redesigned European electricity balancing market, implementation of imbalance settlement harmonisation methodology (ISHM).

Find out more at:

System management

Comparison between the 50Hertz fault rate and that of the German transmission system operators

Faults/100 km of line length

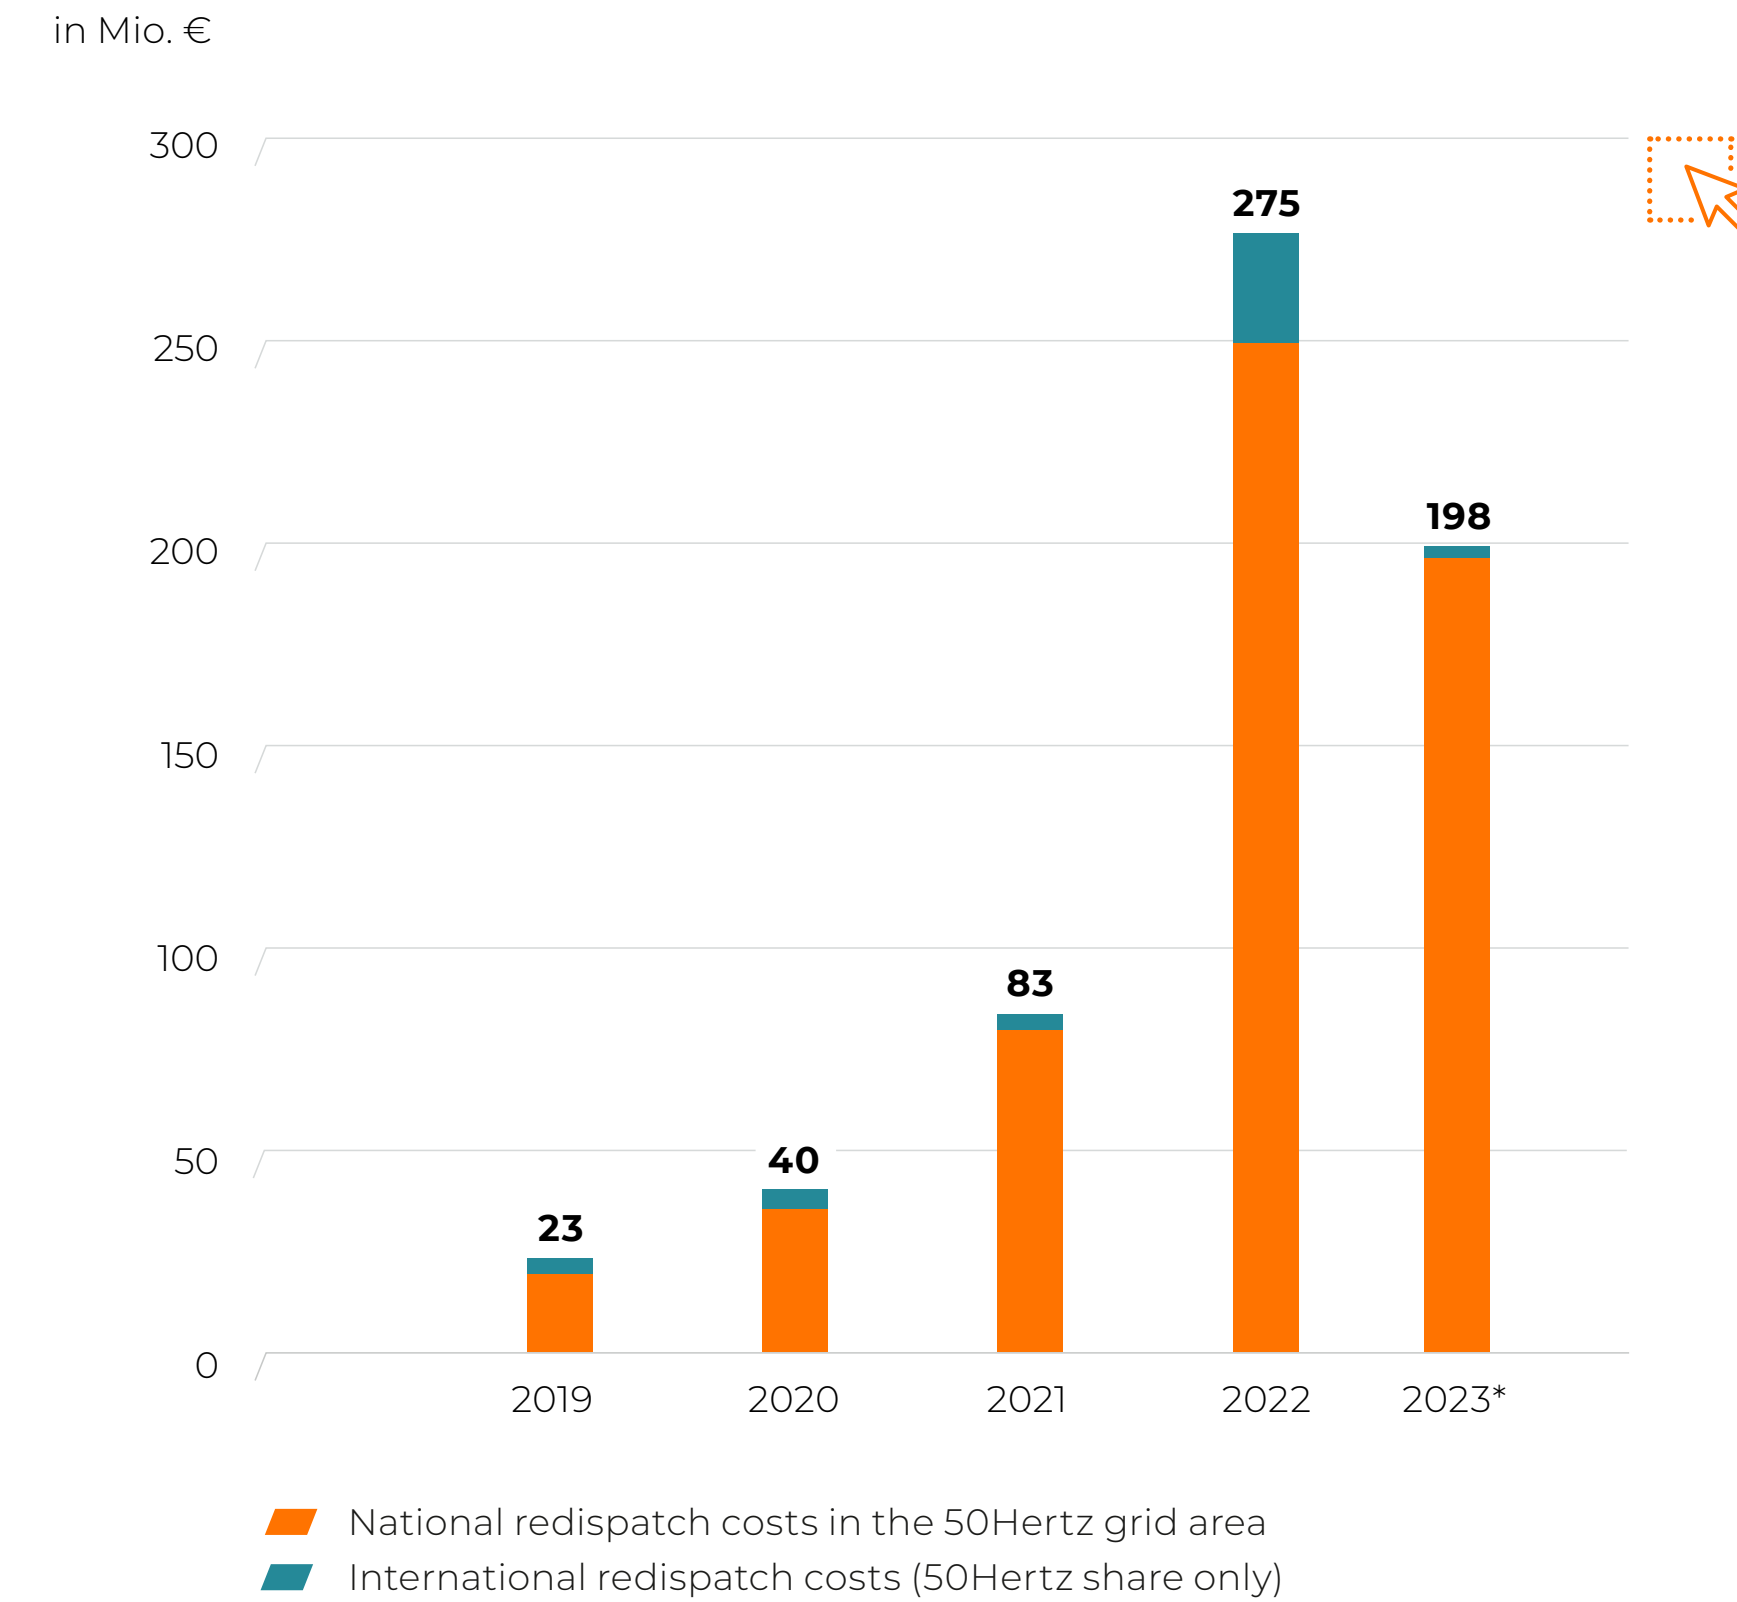

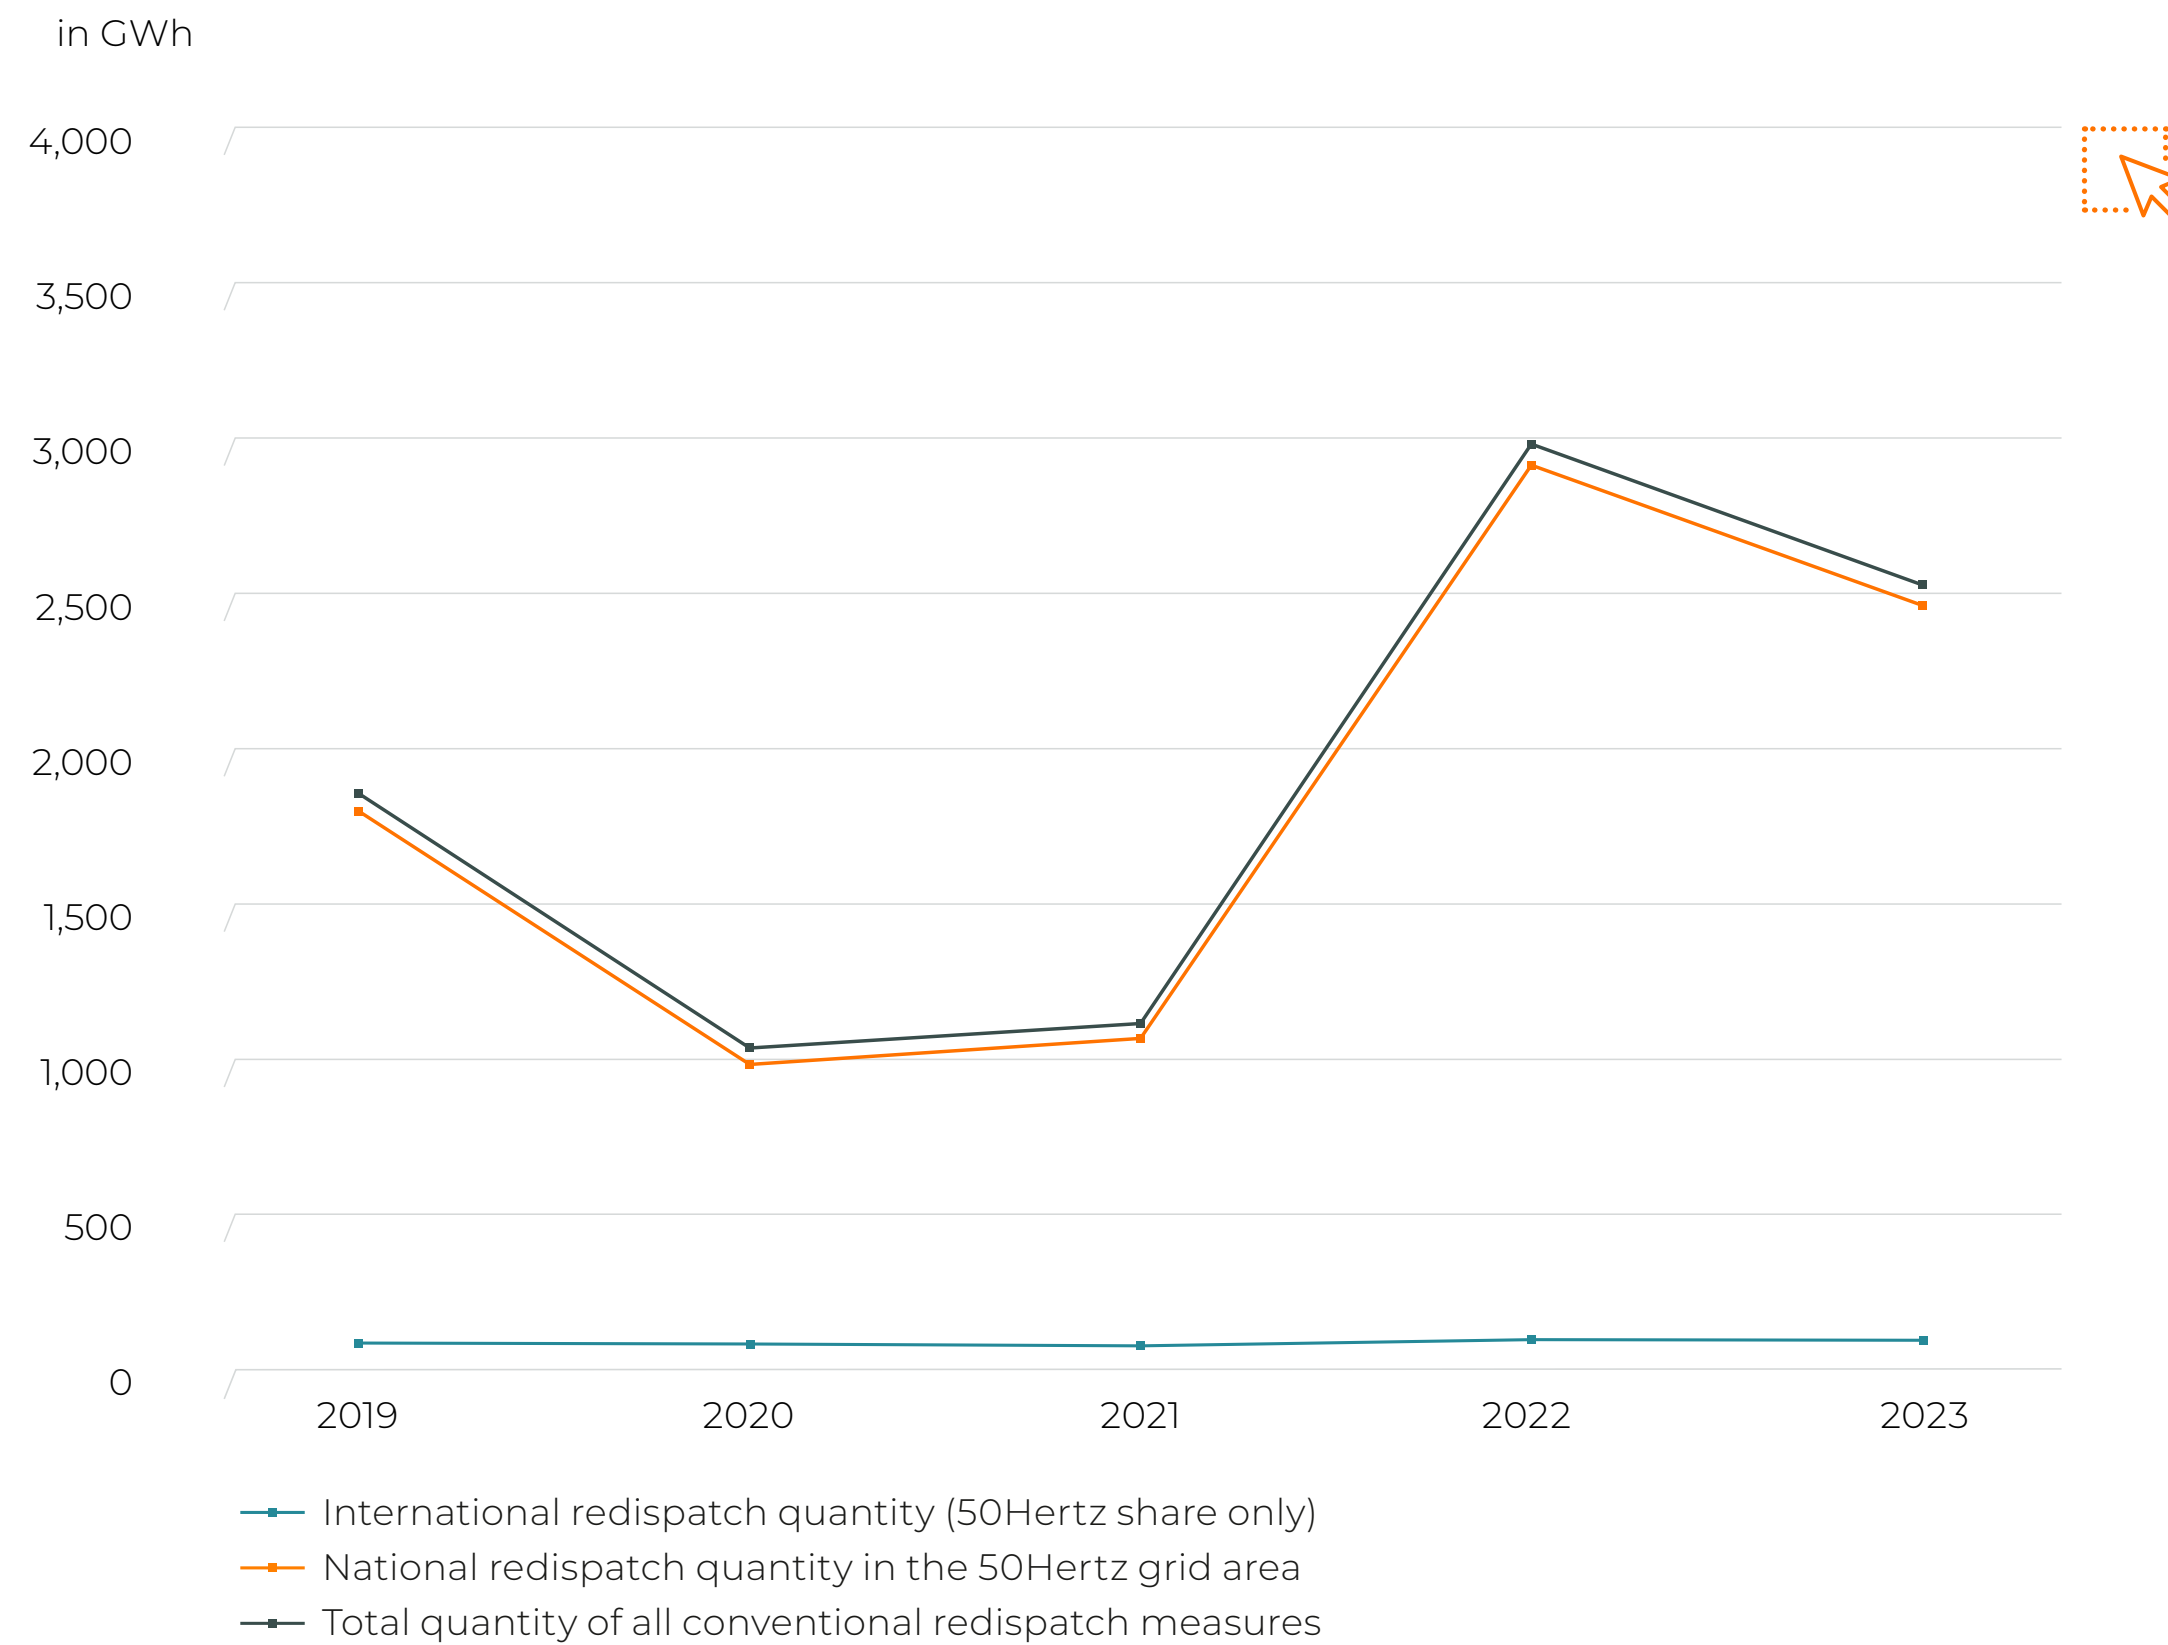

ⓘ An unwanted change of the “normal operating state” is classed as an error that leads to a fault. This takes into account incidents that occur in the active grid used for transmission. Other errors are only recorded if they lead to an unwanted change of the normal operating state of the grid concerned.

Source for the average for all German transmission system operators: Annual report of the “Forum Netztechnik/Netzbetrieb” im VDE (“Forum for System Technology/System Operations” in the German Association for Electrical, Electronic & Information Technologies), the value for 2023 is not yet available at the time of publication.

System management

Development of congestion management measures (conventional redispatch) – quantities and costs

* Preliminary figure

ⓘ There may be rounding differences in the summing up of the individual values.

System management

Development of congestion management measures due to the input reduction for renewable energy plants (for 50Hertz directly and the distribution network) – quantities and costs

in GWh

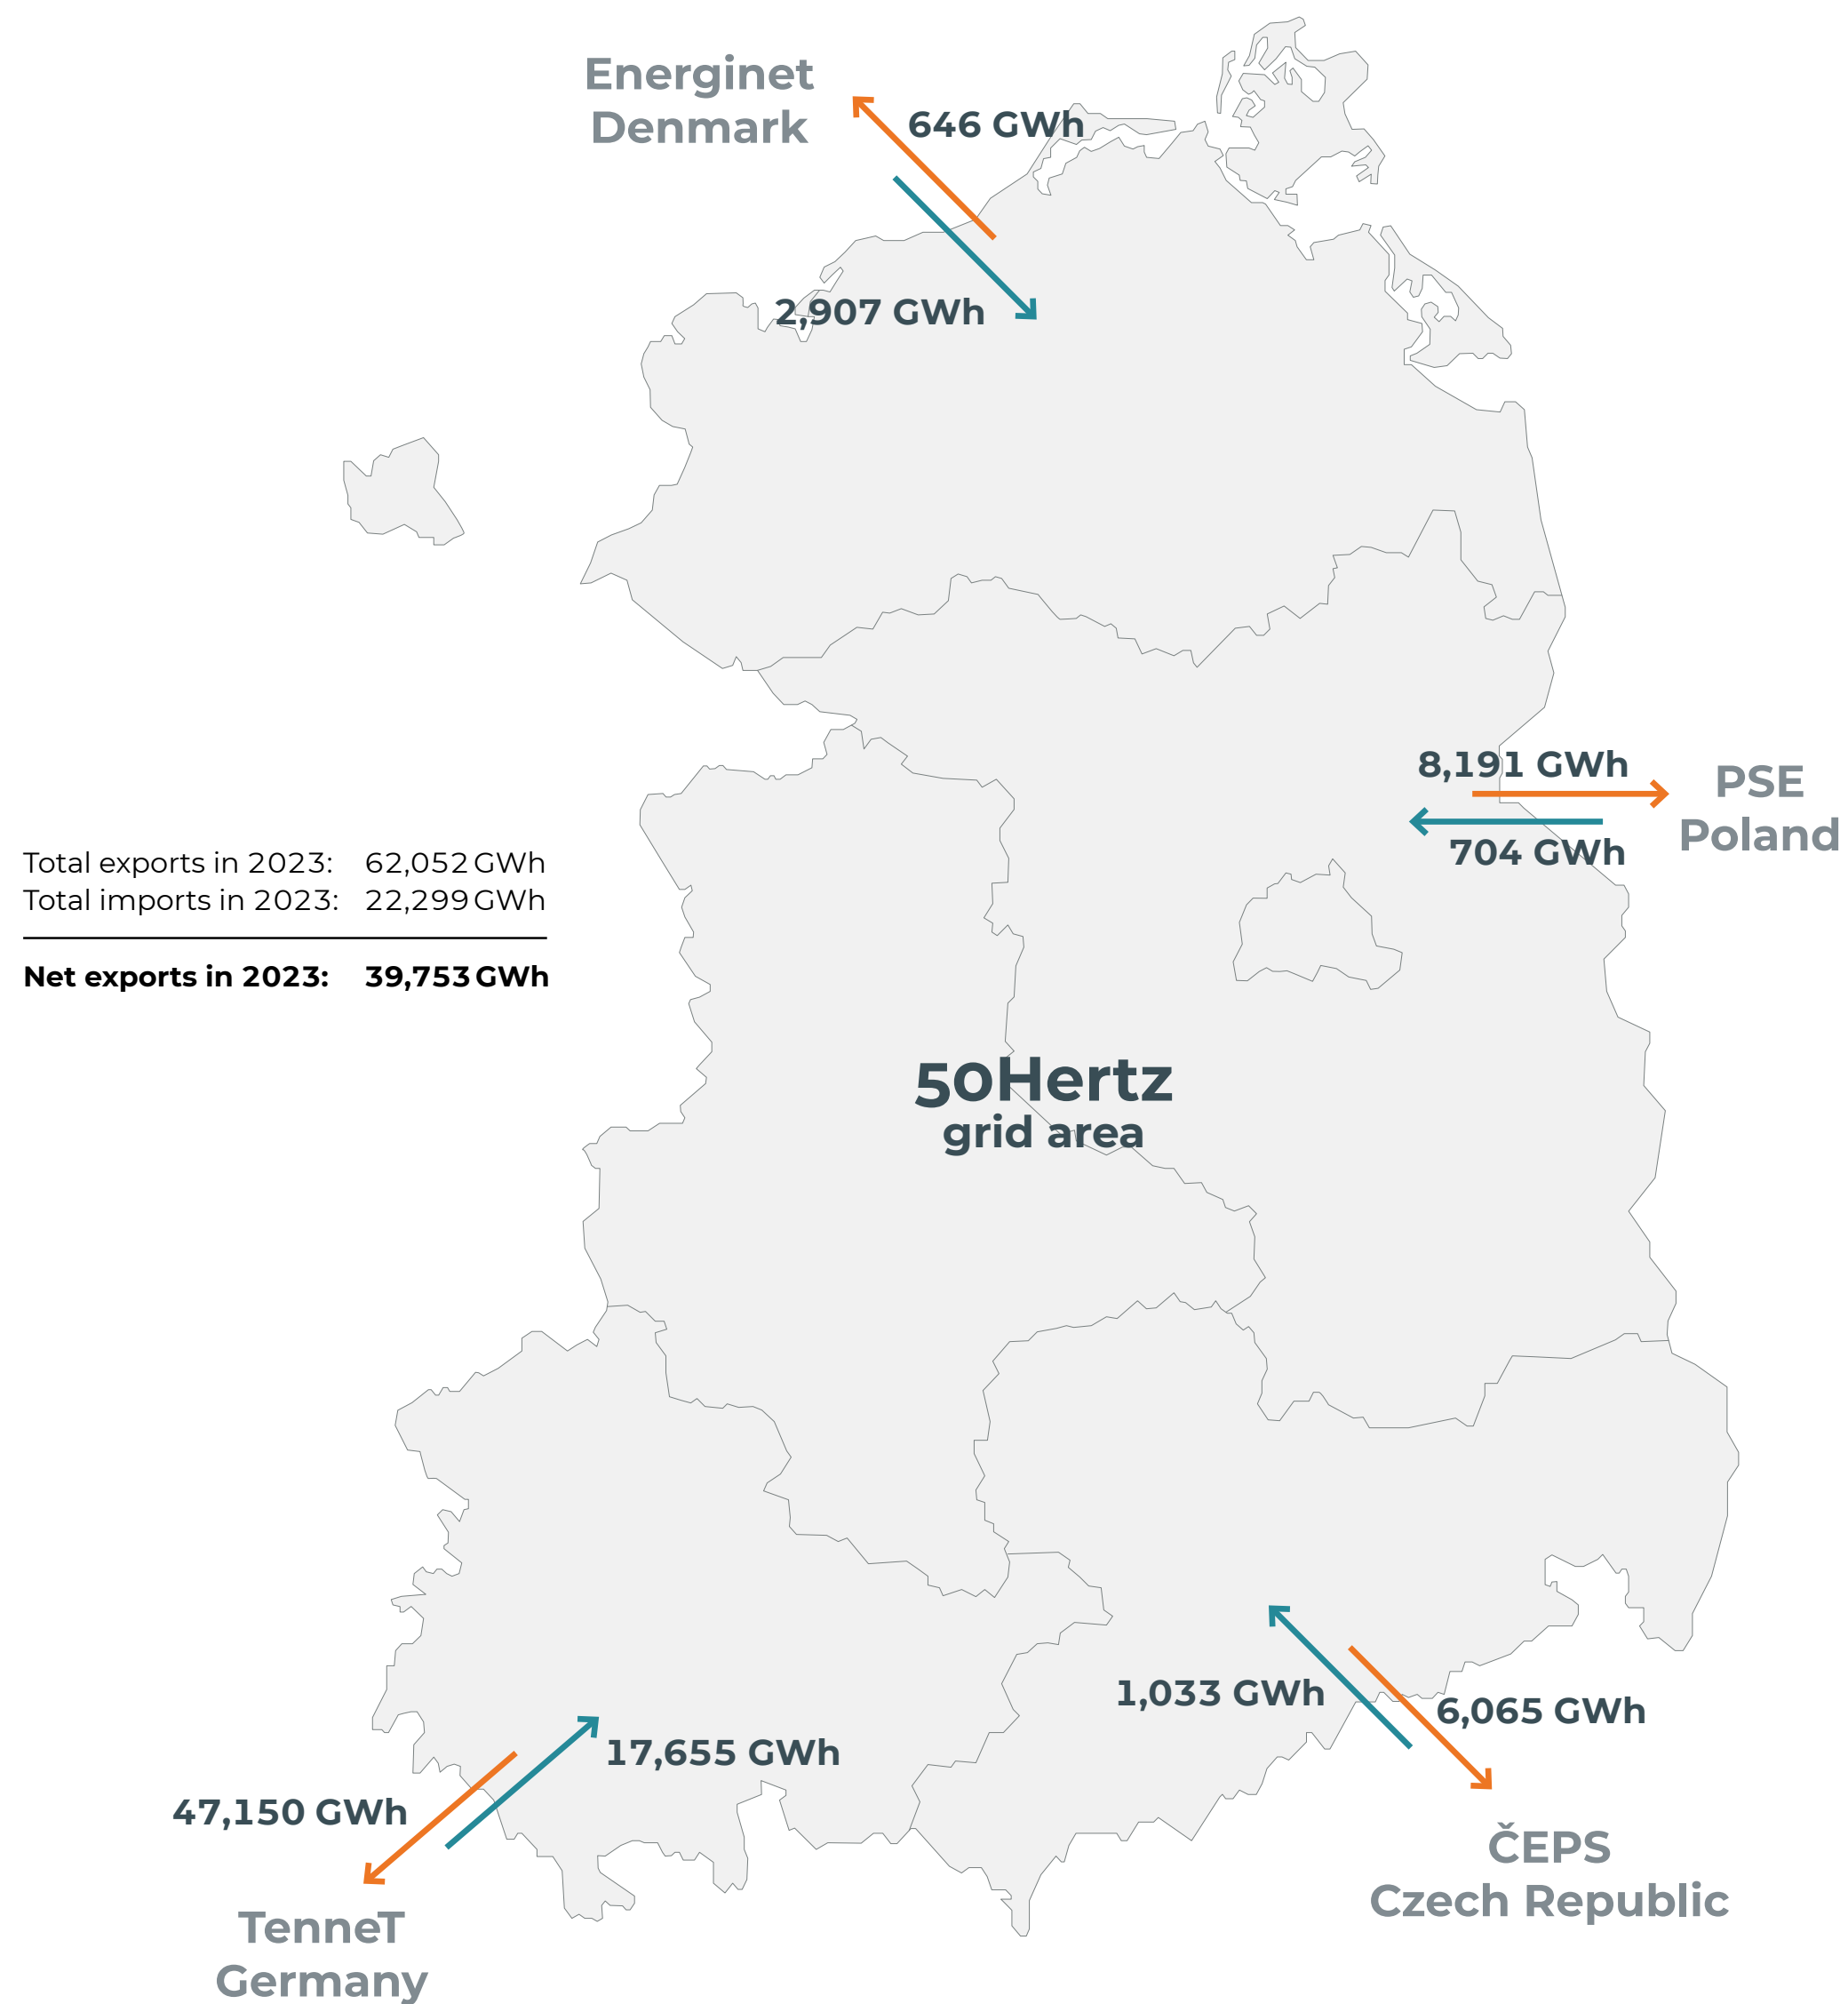

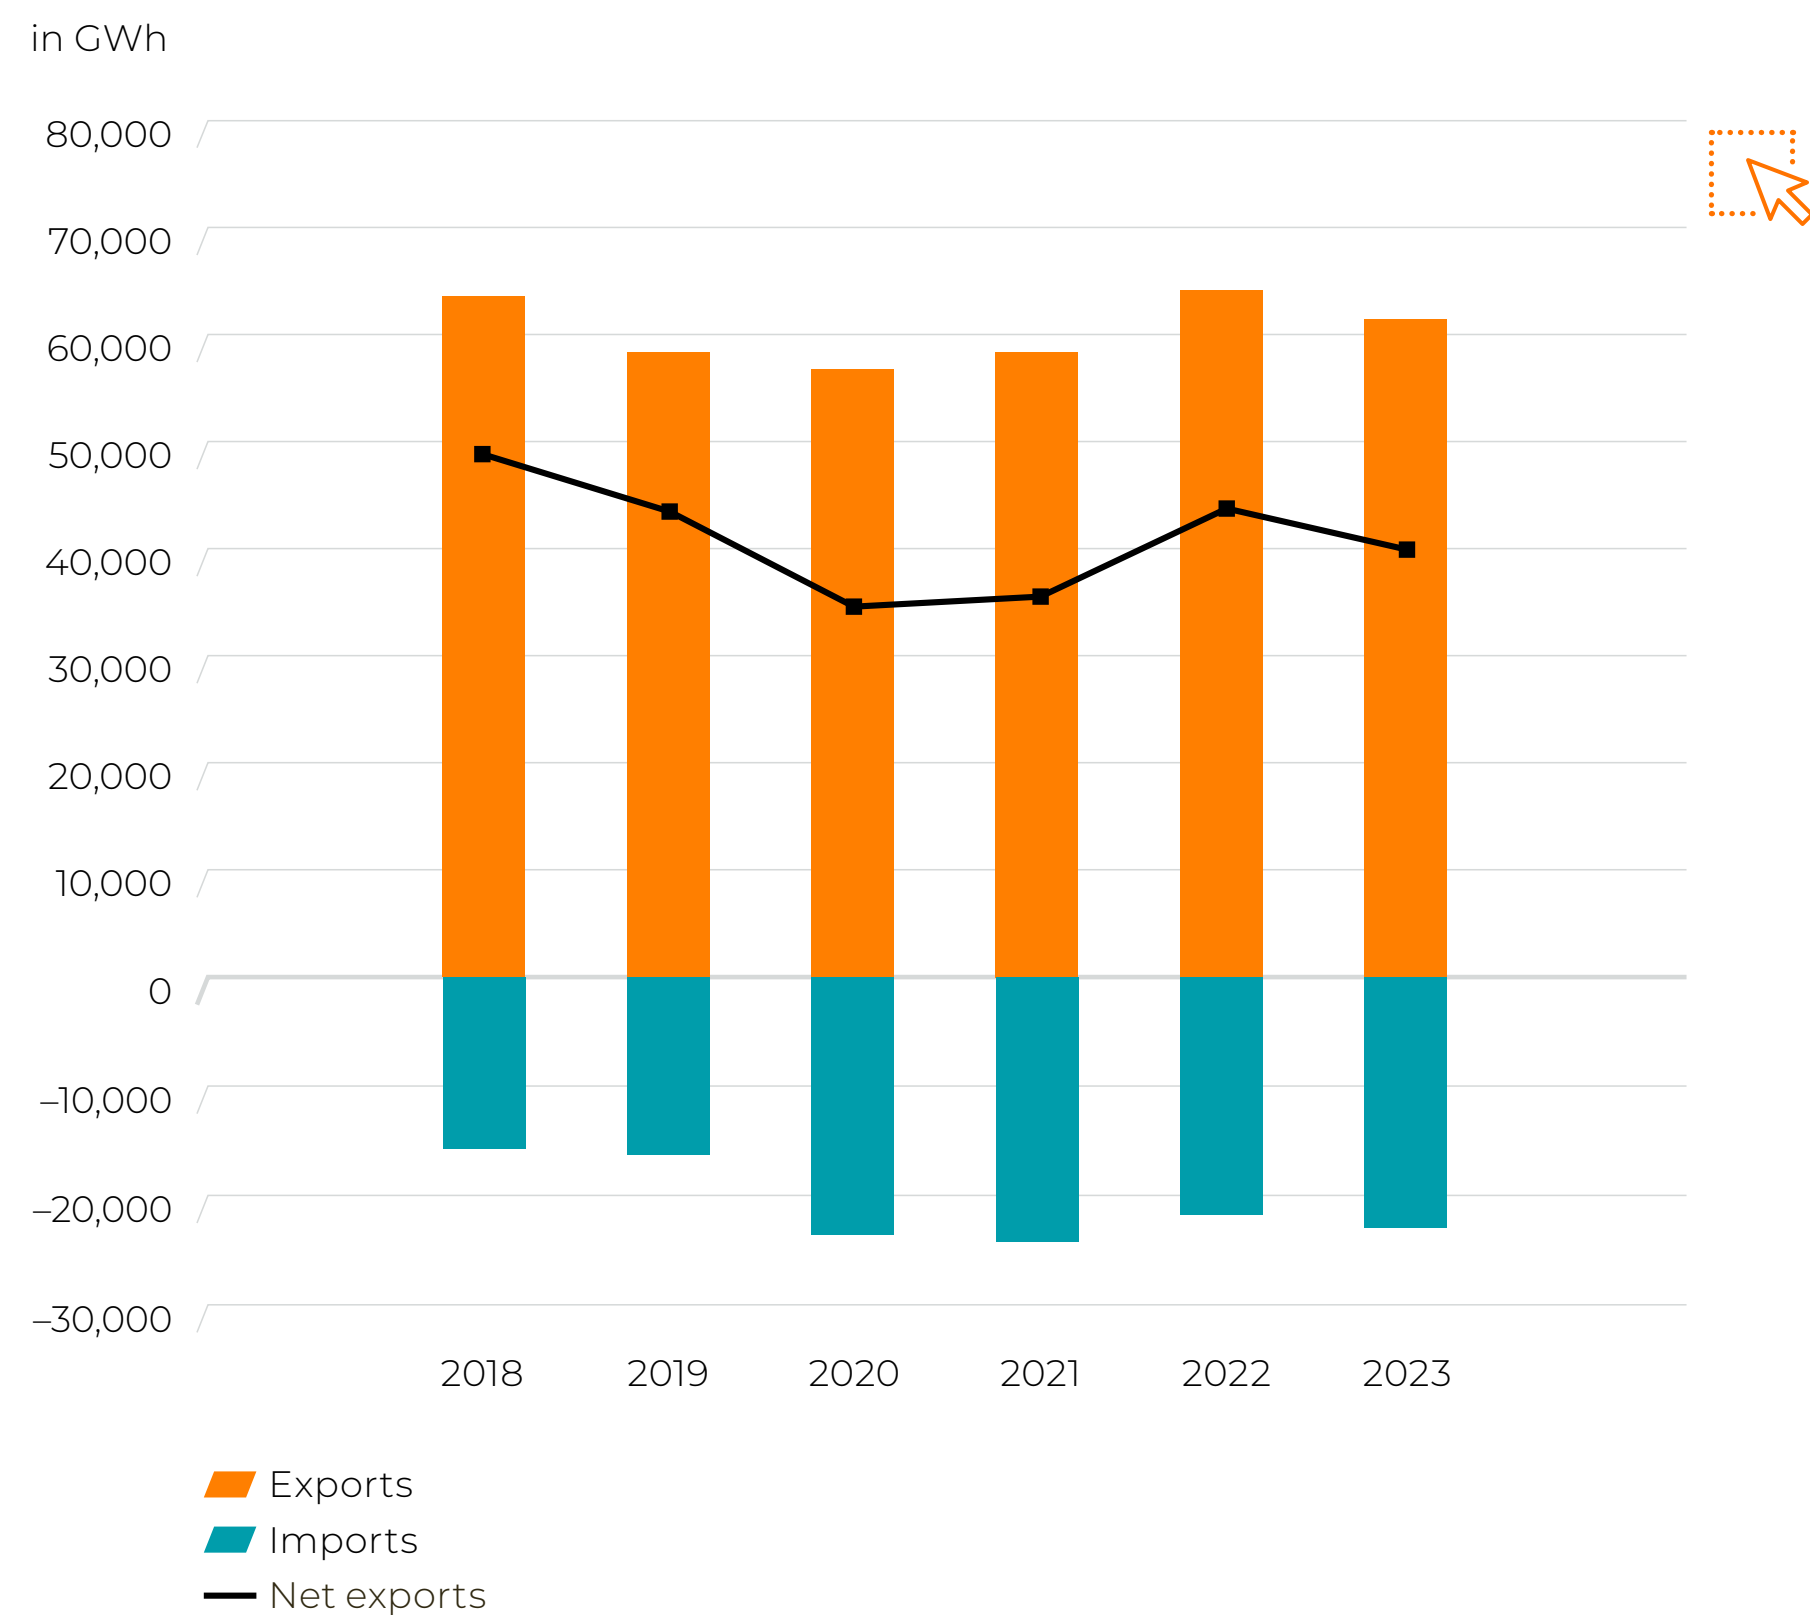

in EUR million

* Preliminary figure

Exchange and transport

Development of exports and imports at the 50Hertz grid area boundaries

Climate and environmental protection

Climate protection:

Greenhouse gas emissions from the German electricity mix

Since this issue, the value has been calculated on an adjusted basis, which has also been applied to the previous year's values since 2020 in order to ensure comparability. For details see: eco2grid.50hertz.com/calculation.

Find out more at: eco2grid.50hertz.com

Greenhouse gas emissions of 50Hertz

SF₆ leak rate (sulphur hexafluoride)

Climate and environmental protection

Environmental protection:

Share of ecologically managed forest routes

Share of line sections fitted with bird-protection markers over the entire line length in European Bird Sanctuaries or migration and resting sites
